### Quantities in Computations

See also list of major variables and list of routines

22SUBSCL: Single precision cell, scale factor Bl4, loaded with bits 6-l of LANDMARK in "S22N7071". A value of 00 means that an N89 input is to be specified, while a value of 01 means that the RLS site is selected. Prior to taking marks (i.e. the N70 display as contrasted with the N71 display), values of 50, - 57, are used to select the advanced ground track mode for use in R52 (where the least significant digit of LANDMARK is employed to determine the number of orbits desired).

ADB: See Digital Autopilot Interface Routines.

ALPHAV: See Coordinate Transformations.

ALT: See Coordinate Transformations.

AZIMANGL: Value of "rotation angle" used in options 4 and 5 (3-axis) of P2O, scale factor BO, units revolutions. It is loaded via R3 of N78, and is also modified in "STARTAUT" when a minimum key rendezvous sequence is started. Cell has no effect unless bit 8(AZIMFLAG) of FIGWRD11 = 1; a "heads up" value is OO and a "heads down" 1800.

BVECTOR: See Measurement Incorporation.

Cnopass: See Optics Computations.

C : Erasable memory (double precision) constant, program notation rpvar "RPVAR", scale factor B28, units meters, giving the "variance of the primary body radius vector."

C s22wsubl: Single precision erasable memory constant, program notation s22wsubl: "S22wSUBL", scale factor B19, units meters, giving the initial conditions for diagonal elements of  $\left[W_{8}\right]$  for known landmark.

CSMPOS: See Measurement Incorporation.

CSTH: See Conic Routines.

CXOFF: Single precision cell, scale factor Bl4, giving the value for bits 12-10 of LANDMARK (shifted right 9 places), which is the offset designator.

DBPTC: Single precision value of deadband used for P2O maneuvers, scale factor B-1, units revolutions. It is loaded into ADB in "R61CSM" and "R67START" (unless a value of zero is indicated, in which case the 0.5° deadband is used). It is initialized to the current ADB at the start of "PROG2O" and can be loaded via R2 of N79.

 $\overline{\text{DELTAV}_{\text{cm}}}$ : See Orbital Integration.

- DELTAX: See Measurement Incorporation.
- DELTLONG: Change in longitude computed in P29 from the time that "HOPALONG" was initiated, scale factor B0, units revolutions. It is the change from the vector reflected in e.g. P21BASER.
- ERADM: See Coordinate Transformations.
- FUDGE: Factor used to convert INGERR information to DELTLONG, scale factor Bl. It approximates the ratio of the number of revolutions of the spacecraft with respect to inertial space to the number with respect to a fixed longitude in equal time periods.
- $K_{35 \rm degang}$ : Constant, program notation "35DEGANG", scale factor BO, units revolutions. Value is -0.097222222222, corresponding to -35°. Used in "PROG2O" to initialize UTPIT for rendezvous options.
- $^{\rm K}$ 600sec: Constant, program notation "600SEC", scale factor B28, units centi-seconds. Value is 60000 x  $2^{-28}$ , corresponding to 600 seconds or 10 minutes.
- Kepsilong: Constant, program notation "EPSILONG", scale factor BO, units revolutions. Value is 0.2777778E-4, corresponding to 0.01° (the P29 convergence criterion).
- K fearth: Constant, program notation "FEARTH", scale factor Bl, used to load FUDGE in P29 for earth orbit. Value is 1.06666667 x 2<sup>-1</sup>, where first term is nominal value (i.e. 16/15) and second is scale factor. Corresponds roughly to proper FUDGE value for an earth-orbiting spacecraft with a period of 90 minutes (16 revs per 24 hours).
- K<sub>fmoon</sub>: Constant, program notation "FMOON", scale factor Bl, used to load FUDGE in P29 for lunar orbit. Value is 0.996958637 x 2<sup>-1</sup>, where first term is nominal value (i.e. 327.8/328.8) and second is scale factor. Corresponds roughly to proper FUDGE value for a lunar-orbiting spacecraft with a period of 2 hours.
- $K_{imuvarr}$ : Constant, program notation "IMUVARR", scale factor B-18, units radians<sup>2</sup>. Value is 0.04E-6 x 2<sup>18</sup>, corresponding to 0.04 mr<sup>2</sup> (the same decimal value, but different scaling, as  $K_{imuvar}$  in Measurement Incorporation).
- K<sub>kpOl</sub>: Constant, program notation "K.Ol", scale factor BO, value O.Ol. Used to convert output from "LAT-LONG" from units of meters to units of meters/100, so that the DSKY display scale, usually XXXX.X nmi, will be XXXXXb. nmi instead for P2lAIT.
- K sctvar: Constant, program notation "SCTVAR", scale factor B-18, units radians. Value is 1.0E-6 x 2-18, corresponding to 1.0 mr<sup>2</sup>.

- K twiceeps: Constant, program notation "TWICEEPS", scale factor BO, units revolutions. Value is 0.5555556E-4, corresponding to 0.020, or twice the value of K epsilong.
- LANDALT: Cell used by N89 to display altitude information, scale factor B29, units meters. The scaling from normal XXXX.X to XXX.XX nmi is handled for N89 by the noun table information.
- LANDLONG: Cell used by N89 to display longitude information, scale factor BO, units of two revolutions (hence if treated as if in units of revolutions, display would be of  $\frac{1}{2}$  the true angle).
- LANDMARK: Single precision cell which is displayed in R2 by N7O and N71. Considering the five octal digits displayed to be ABCDE, the following code is assigned:
  - A: Used in P22 to indicate known landmark if 1, unknown if 2 (other values not allowed).
  - B: Used in P22 to load CXOFF (offset mark serial number). Digit set O at start of "PROG22A", and can be set to the serial number of the mark just made by V52E. If loaded manually, values in excess of five are rejected, and in excess of NUM8NN cause no processing in "S22I=N".
  - C: Used in P23 to indicate earth of 1, lunar if 2 (other values not allowed). If LANDMARK = 0, P23 requires a horizon measurement.
  - DE: Landmark identification. Value ignored by P23 (except for impact on zero/non-zero nature of LANDMARK cell).

    In P22, used to indicate that an N89 input is required if OO, and that RLS should be used if Ol. For the N71 display, these are the only two values allowed. For the N71 display, values in the range 508 578 are also allowed, specifying O-7 advanced orbits for R52.

LAT: See Coordinate Transformations.

LNGERR: Value of longitude error in P29, scale factor BO, units revolutions. Stored in push-down list location OD.

LONG: See Coordinate Transformations.

LONGFOR: Value of desired longitude (entered into R2 of N43) in P29, scale factor B0, units revolutions.

MARKTIME: See Measurement Incorporation.

MUSUBC: Unit vector, scale factor Bl, perpendicular to polar vector and MUSUBE, used in P29.

MUSUBD: Unit vector, scale factor B1, used in P29 iteration to compute ORBDLT. Stored in push-down list locations OD and 6D.

- MUSUBE: Unit vector, scale factor Bl, in easterly direction, used in P29.
- MUSUBN: Unit vector, scale factor Bl, in plane defined by angular momentum (and same hemisphere as north polar axis), used in P29.
- MUSUBS: Unit vector, scale factor Bl, in direction of tangential velocity for P29 computations.
- N49DISP, N49DISP+2: See Measurement Incorporation.
- NUM8KK: Single precision cell, program notation "8KK", scale factor B14, containing the serial number of the mark being processed in P22. It is initialized to 1 in "DOV5N71", and incremented in "S22I=N". Cell also used for temporary storage in "S22N7071" of verb/noun pattern. The following cell is used in the same routine as a control flag (zero means N71, and non-zero, i.e. 1307<sub>8</sub> = 711, means N70: the octal is O571<sub>vn</sub>).
- NUM8NN: Single precision cell, program notation "8NN", scale factor Bl4.

  Initialized to zero in "SXTMARK" for P22 and P24, and incremented for marks (decremented P22 mark rejects) in the optics processing logic.

  Mark processing in "S22I=N" is halted when NUM8NN equals NUM8KK.
- OPTION2: See Display Interface Routines.
- OPTNTYPE: Single precision cell, scale factor Bl4, used to retain information on the P2O option selected: it is set equal to (bits 2-1 of OPTION2) 1, hence zero for selection of option 1/5(celestial body) and 1 for selection of option #2 (rotation). Not loaded for option O/4 (rendezvous).
- ORBDLT: Required angle change (converted via "TIMETHET" to a time and a new position vector) in the P29 loop, scale factor BO, units revolutions. Stored in push-down list location OD.
- P21ALT: Value of K<sub>kpOl</sub> ALT computed in "P21PROG2" for (optional) display in Rl of N73, scale factor B29, units (meters/100): see K<sub>kpOl</sub>.
- P21BASER: Value of P21/P29 "base" vector for position (notation also P29BASER), scale factor B29 (earth) or B27 (moon), units meters. The earth/moon scaling determined for P21 by P21ORIG (P29 computations not intended for use except in orbit, hence use CSM state vector flag instead). In P21, loaded after completion of integration to specified input time, and used to initialize the integration if bit 12(P21FLAG) of FLAGWRD2 = 1, thus permitting computation time to be saved if it is desired to iterate about a point which is a number of orbital integration time steps removed from the "permanent" CSM/LM state vector.
- P21BASEV: Value of P21/P29 "base" vector for velocity (notation also P29BASEV), scale factor B7(earth) or B5(moon), units meters/centisecond. See P21BASER.

- P2lGAM: Value of flight path angle computed in "P2lPROG2" for (optional) display in R3 of N73 in P2l, scale factor B0, units revolutions.
- P210RIG: Single precision value for "origin" information for P21 base vector (not used by P29), scale factor B14. A value of 0 means earth, and a value of 2 means moon.
- P21TIME: Cell used to retain time information (notation also P29BASET), scale factor B28, units centi-seconds. Used to contain the time tag of P21BASER and P21BASEV, and to permit the incrementing of the time associated with the N34 display.
- P21VEL: Value of velocity computed in "P21PROG2" for (optional) display in R2 of N73 in P21, scale factor B7, units meters/centi-second.

PASSCNT: See Optics Computations.

- PASSTIME: Time associated with current iteration in P29 loop, scale factor B28, units centi-seconds. When convergence criterion is satisfied, information in this cell is loaded in DSPTEM1 for N34 display.
- [PDMXI]: Identity matrix stored in push-down list, scale factor of elements B3. With respect to the conventional sequence, for convenience in using the push-down list, PDMXI, has unitX; PDMXI, has unitY, and PDMXIO has unitZ. Stored in push-down list location OD.
- PLANVCUT: Value of STARSAV3 (N88) information sampled in "VlN7ODSP" for use in options 1 or 5 of P2O (display generated if N7O = +0). Can be with arbitrary (but consistent) scaling.

pMGA: See Display Computations.

- R61CNTR: Single precision cell, scale factor Bl4, used for control of "R61CSM", and as a flag (if negative) that this routine has called R60 (requiring DSKY priority displays for the performance of the maneuver). Positive values cause the cell to be decremented and performance of the remainder of the routine to be bypassed; the setting to 3 causes the routine to be performed every fourth time it is entered, assuming that R61CNTR is not set 0 by the calling routine.
- R67TIME: Value of the time at which maneuver is to be started for option 2 of P2O, loaded in "P2OOPT" from N34 information, scale factor B28, units centi-seconds. Used in "CALLR6X" to determine when "R67" should be called, for OPTNTYPE > O (i.e. option 2).

RCLP: See Measurement Incorporation.

 $RC\underline{V}$ ,  $RC\underline{V}_{cm}$ : See Orbital Integration.

RLS: See Coordinate Transformations.

RVEC: See Conic Routines.

- S22D: Value of S22RL · UM, scale factor B29, units meters, stored in push-down list location 30D.
- S22EORM: Single precision cell, scale factor B14, used as a shift and control cell in P22 (loaded at start of "S22.1" with O for earthcentered computations and -2 for moon-centered computations).
- S22LOC: Single precision cell used to retain information on the address of the mark data for processing in P22. It is initialized to the address of SVMRKDAT in "DOV5N71", and incremented by 7 in "S22I=N".
- S22RHO: Cell used for temporary storage purposes in P22 (and P24 when computing a revised landmark location), corresponding to push-down list location 32D. When used to multiply UM, scale factor is B30 (earth) or B28 (moon). When used to compute initial values for [S22UUT], scale factor is partially contained in X2 (if X2 = 0, scale factor B42); for second term of [S22UUT], scale factor B34.
- S22RL: Value of landmark vector in P22 rescaled to scale factor B29, units meters (same scaling for earth and moon).
- S22TOFF: Value of time tag (i.e. time of measurement) for the offset optics mark in P22, scale factor B28, units centi-seconds, loaded in "S22NXTIN" if NUM8KK = CXOFF. In P24, or if no offset mark was specified in P22, used to contain time tag of mark for use in converting X789 to latitude/longitude/altitude information for possible display and, for P22, RLS loading.
- S22TPRIM: Value of time of last mark processed in P22, scale factor B28, units centi-seconds, for use in "S22NXTIN" to update the value of X789 to the time of the next mark.
- [S22UMRL]: Value of matrix quantities used in P22 for initialization of  $W_0$  and  $W_7$ , initially with scale factor B30 and then, after computation involving division by S22D, with scale factor B3. Also used for computation of information for  $W_8$ , where has scale factor B2.
- S22UOFF: Value of UM (measurement vector) for the offset optics mark in P22, scale factor B1 (see S22TOFF).
- [S22UUT]: Value of matrix quantities used in P22 for initialization of [Wg], scale factor B36. S22UUT<sub>i</sub>, with i = 0, 3, 4, 6, 7, and 8, corresponds to what may appear elsewhere as e<sub>j</sub> (j = 0 5 respectively).

SNTH: See Conic Routines.

STARCODE: See Inflight Alignment.

STARSAV3: See Inflight Alignment.

SVMRKDAT: Set of buffer cells used to telemeter mark information in P22 and P24. Up to 5 sets of mark data may be handled, each of which has the double precision value of mark time, followed by CDU, optics shaft, CDU, optics trunnion, and CDU. In P24, cells initialized to zero before optics marks initiated. In both P22 and P24, time tags are complemented to indicate a mark rejection. P24 loads the cells cyclically as marks are obtained (P22 has a limit of 5 marks, filling the buffer). The initialization is to a binary zero, meaning a "scaled value" for trunnion information of -19.7754°, as might be seen on some displays.

T: See Conic Routines.

T<sub>et</sub>: See Orbital Integration.

UM: See Measurement Incorporation.

UTPIT: Value of "pitch angle" used in P2O, scale factor BO, units revolutions. It is loaded via R2 of N78, with a value of -35° the normal rendezvous initialization (preferred tracking axis) value.

UTYAW: Value of "yaw angle" used in P2O, scale factor BO, units revolutions. It is loaded via Rl of N78, with a value of zero the normal rendezvous initialization: zeros for UTPIT and UTYAW correspond to +X axis tracking.

USTAR: See Measurement Incorporation.

UTSTARNO: Value of STARCODE information sampled in "VIN7ODSP" for use in options 1 or 5 of P2O. Scale factor B14.

VARIANCE: See Measurement Incorporation.

 $VC\underline{V}$ : See Orbital Integration.

VVEC: See Conic Routines.

 $\lceil W_i \rceil$ ,  $W_i$ ,  $\underline{W}_i$ : See Measurement Incorporation.

WORBPOS, WORBVEL: See Measurement Incorporation.

X789: See Measurement Incorporation.

Return (to routine calling "TARGDRVE")

#### Quantities in Computations

See also list of major variables and list of routines

- ldPIPADT: See IMU Computations.
- 1SECXT1: Single precision quantity, scale factor Bl4, units centiseconds, giving required period of computations for "ALLOOP". Set to 0.5 seconds for gyro compassing.
- Catd: Erasable memory (double precision) constant, program notation "LATITUDE", scale factor BO, units revolutions. It gives the "local vertical astronomical latitude" of the pad.
- Cazmth: Erasable memory (double precision) constant, program notation "AZIMUTH", scale factor BO, units revolutions. It gives the "azimuth of the vehicle Z-axis east of north."
- CDUSPOT: See Coordinate Transformations.
- DESOPTS, DESOPTT: See Optics Computations.
- DPIPAi (i = Y,Z): Value of accelerometer output modified for use in gyrocompassing. The y axis of this system is south and the z axis is east (from  $[X_{sm}]$ ). Scale factor of DPIPAi is BL4, units accelerometer counts.
- ERCOMP: Value of gyro compensation to be sent to gyros, scale factor B21, units pulses (or scale factor B0, units revolutions, since one pulse is 2-21 revolution). Program notation also "ERCOMP1".
- ERECTIME: Single precision length of time to be spent in erection phase, scale factor Bl4, units of five-second gyro compassing cycles. It is set to LENGTHOT in "ESTIMS". Program notation also "ERECTIM1".
- ERVECTOR: Earth rotation vector initialized in "ESTIMS", scale factor Bl, units gyro pulses/centi-second.
- FILDELV1 . Filtered velocity in the y and z directions, scale factor B1 $\mu$ , units accelerometer counts. Here "y" is north.
- GCOMP, GCOMPSW: See IMU Computations.
- GEOCOMP1: Single precision cell set positive non-zero to indicate that gyro-compassing computations are being performed. The logic that checks this cell is <u>not</u> shown in this writeup. See Testing Routines.
- GTSWTLT1: Single precision cell, scale factor BL4, units centi-seconds, giving the value of TIME1 when "ALLOOP" last entered, and used to construct proper waitlist value for the next call in "SETGWLST".

- INTVECL, : Summed values of FILDELV1, and FILDELV1 respectively, scale factor B14, units accelerometer counts.
- $K_{\rm ld2scx}$ : Single precision constant, program notation "l/2SECX", scale factor Bl4, units centi-seconds. Value is 50 x  $2^{-14}$ , corresponding to 0.5 second.
- Kldppgt: Single precision constant, program notation "1/PIPAGT", scale factor B8, units centi-seconds. Value is 062008, corresponding to 0.5 seconds.
- K<sub>bt7</sub>: Single precision constant, program notation "BIT7", scale factor B14, units of five-second gyro compassing cycles. Octal value is OO100<sub>8</sub>, corresponding to decimal 64, used to load LENGTHOT, and thence ERECTIME, for a change in input azimuth: value gives 64 x 5 = 320 seconds for vertical erection.
- K<sub>bt8</sub>: Single precision constant, program notation "BIT8", scale factor B14, units of five-second gyro compassing cycles. Octal value is 00200, corresponding to decimal 128, used to load LENGTHOT, and thence ERECTIME, at start of PO1 (in "GTSCPSS"): value gives 128 x 5 = 640 seconds for vertical erection at start of PO2.
- ${\rm K}_{\rm geoc2}$ : Constant, program notation "GEOCONS2", scale factor BO, value 0.005.
- K geoc3: Constant, program notation "GEOCONS3", scale factor B7, units gyro pulses/accelerometer pulse. Value is 0.062, corresponding to a "true" value of 7.936.
- K geoc4: Constant, program notation "GEOCONS4", scale factor B7, units gyro pulses/accelerometer pulse. Value is 0.0003, corresponding to a "true" value of 0.0384.
- K geoc5: Constant, program notation "GEOCONS5", scale factor B7, units gyro pulses/accelerometer pulse. Value is 0.5, corresponding to a "true" value of 64.
- $K_{\rm omegms}$ : Constant, program notation "OMEG/MS", scale factor BO, units gyro pulses/centi-second. Value is 0.24339048, corresponding approximately to (1/86164.0932) x  $10^{-2}$  x  $2^{21}$ , where first term is earth rotation period in seconds (used to derive constant), second converts to centi-seconds, and third is number of gyro torquing pulses in one revolution.
- K pipgyr: Dummy constant used to indicate change in units between accelerometer pulses and gyro torquing pulses, scale factor B7. Value is 1.00, corresponding to 27 or 128.

LAUNCHAZ: Value of desired launch azimuth, scale factor BO, units revolutions. Since is used at the start of POl, should form part of prelaunch erasable load, although it can also be updated in "AZMTHCG1" (via V78E). Program notation also "LUNCHAZ1".

LENGTHOT: Single precision cell, scale factor Bl4, loaded in "GTSCPSS" with K<sub>bt8</sub> (for loading into ERECTIME) and at the end of "ALFLT", if a new azimuth specification received, with K<sub>bt7</sub>. It is also used as a counter of the number of half-seconds that have elapsed since the previous entrance to "EARTHR\*", to control the nominal gyro compassing cycle of five seconds (via an initial setting to 9 and a lSECXTl setting to 0.5 seconds).

LGYRO: See IMU Computations.

LOSVEC: Unit vector, scale factor Bl, serving in "GCOMPVER" as a temporary storage cell for the sighting vector to the first target.

MARKINDX, MRKBUF1: See Optics Computations.

NDXCTR: Single precision cell, scale factor Bl4, used in "GTSCPSS" to retain information on bit 14(GLOKFAIL) of FLAGWRD3, which should be 0 if do POl.

NEWAZMTH: Communication cell with "POSN17C", scale factor BO, units revolutions, used to compute the required orientation of the stable member. Program notation also "NEWAZ1". Set to LAUNCHAZ in "GTSCPSS" and "ALFLT" (if an input azimuth change).

OGC: See Coordinate Transformations.

OLDAZMTH: Value of azimuth angle presently reflected in computations, scale factor BO, units revolutions. If, with PREMTRXC = O, LAUNCHAZ = OLDAZMTH, it is concluded that no input change took place, and no re-initialization (via entrance to "ESTIMS") of gyro compassing is done. OLDAZMTH is set as described for NEWAZMTH, but at a slightly different time for restart considerations.

OPTIND: See Optics Computations.

PAC: See Coordinate Transformations.

PERFDLAY: Communication cell with routine calling "GOESTIMS", set to one centi-second at start of "GTSCPSS", scale factor B28, units centi-seconds (the "LONGCALL" entrance to the waitlist system is used).

PIPA: See IMU Computations.

PREMTRXC: Single precision cell, scale factor Bl4, initialized to 1 in "GTSCPSS" and set 0 at the end of "AZMTHCG1". If sensed as 0 in "ALFLT" (when LENGTHOT has run down), then, if LAUNCHAZ ≠ OLDAZMTH, gyro compassing is re-initialized. In any event, PREMTRXC is reset to 1. Program notation also "PREMTRX1".

SAC: See Coordinate Transformations.

STAR: See Coordinate Transformations.

STARAC, STARAD, STARBC, STARBD: See Coordinate Transformations.

STARCODE: See Inflight Alignment (setting in "GCOMPVER" is not functional, since the cell is <u>not</u> displayed by the mark routine).

T : Value of time when previous earth-rate compensation was made, scale factor B28, units centi-seconds.

TAZ<sub>1</sub>, TAZ<sub>2</sub>, TEL<sub>1</sub>, TEL<sub>2</sub>: Single precision erasable memory cells (which could be set as part of erasable memory load) giving azimuth (TAZ<sub>1</sub>) and elevation(TEL<sub>1</sub>) for targets #1 and #2 used in PO3. For azimuth information, scale factor is B-1 in twos complement; for elevation, scale factor is B-2: in both cases, units are revolutions.

THETAN: Value of required number of gyro torquing pulses (before rotation by [X], and hence in the vertical, south, east system), scale factor B21, units pulses. Program notation also "THETAN1".

Proceed to 2nd line of "P72"

CDHMVR Entered from "CIRCL", "HARTBURN", and "P33/P73B"

 $UNVE\underline{C} = unit\underline{R}_{act2}$ 

CSTH = unitR ounvec

 $SNTH = \sqrt{1 - CSTH^2} \quad sgn \left( \left( - \frac{R}{act2} * \frac{R}{pass2} \right) \cdot UP_{\underline{1}} \right)$ 

X2 = RTX2

 $VVE\underline{C} = \underline{V}_{pass2}$ , shifted left X2 places (B7 earth, B5 moon)

X1 = RTX1

Set bit 9(RVSW) of FLAGWRD7 = 0 (means new R, V are desired)

 $RVEC = R_{pass2}$ , shifted left X2 places (B29 earth, B27 moon)

Perform "TIMETHET"

 $PD18\underline{V} = T\underline{S}_{V}$ , shifted right RTX2 places (B7)

PDO2R =  $|TS_{2}|$ , shifted right RTX2 places (B29)

DIFFALT = PDO2R -  $\frac{R_{act2}}{}$ 

TS = Rl, shifted right RTX2 places (B29)

PDSEMAP = TS / RdA(gives semi-major axis of passive vehicle)

PDSEMAA = PDSEMAP - DIFFALT

 $PDVAV = (PD18\underline{V} \cdot UNVE\underline{C}) (PDSEMAP / PDSEMAA)^{3/2}$ 

 $\underline{V}_{act3} = PDVAH unit(UP1 * UNVEC) + PDVAV UNVEC$ 

 $DELVEET2 = \underline{V}_{act3} - \underline{V}_{act2}$ 

Return

#### Quantities in Computations

See also list of major variables and list of routines

ACTCENT: Value of active vehicle central angle of transfer computed in "S3435.25" (entered for P34/P74 and P35/P75), scale factor BO, units revolutions, in range  $0-360^{\circ}$ . It can be displayed at crew option in Rl of N52: if too close to  $180^{\circ}$ , then the maneuver parameters should be reconsidered.

AUTOY: See Burn Control.

CENTANG: See Burn Control.

CMYDOT: See Burn Control.

COZY4: Criterion used in "INITVEL2" to decide if input position vector and target position vector are too close to 180 degrees, scale factor B2. It is initially loaded with the cosine of TS, in "INITVEL", where TS, stored in push-down list location 2D as an angle, B0 revolutions, is angle away from 180 within which "INITVEL2" rotates the target vector to be in the plane of Rinit and Vinit. Before entering "INITVEL2", COZY4 is changed to be the sum of the cosine and the dot product of the initial and original target vectors (hence if it is negative, then the "INITVEL2" logic must be invoked: e.g. if TS, set to 15 degrees, then an angle of 165° to 195° would cause the R2VEC rotation). If outside the cone, then NORMSW is left at 0, causing "LAMBERT" (in "GEOM") to compute a UN as perpendicular to original and target position vectors.

CSIAIRM: Cell used single precision (although initialization to O is done double precision), scale factor Bl4, to contain the value of the index used with K to generate a program alarm in "ALMXIT". If "SCNDSOL" is entered for an alarm condition but bits 13-12 of FIGWRD11 indicate that computation starting (value of Ol2), then CSIAIRM loaded with the cause of that entrance to "SCNDSOL"; a subsequent entrance, perhaps for a different reason, would cause "ALMXIT" to display the first alarm code.

CSTH: See Conic Routines.

DELDV: Value of required change to DELVCSI, scale factor B7, units meters/centi-second.

DELEL: Value of error between derived and specified values of elevation angle in "ELCALC", scale factor BO, units revolutions.

DELELO: Value of previous DELEL, scale factor BO, units revolutions, in 26D.

DELLT4: Communication cell with "INITVEL", containing desired time of flight from  $\underline{R}_{init}$  to  $\underline{R}_{targ}$ , scale factor B28, units centi-seconds. It is loaded into TDESIRED for use in Lambert routine.

DELTEEO: Value of time increment information in "ELCALC" (generally the value added to NOMTPI), scale factor B28, units centi-seconds.

- DELVCSI: Magnitude of velocity change required for the CSI burn (as determined in "CSI/B"), scale factor B7, units meters/centi-second. The vector velocity is DELVEET1, although the latter quantity can be superseded if desired by loading new velocity components for the N81 display in "P32/P72C". This revised loading would not be reflected in DELVEET1, however.
- DELVEET1: Vector velocity change required for the CSI burn, scale factor B7, units meters/centi-second. Magnitude is in DELVCSI. It can be superseded in "P32/P72C" by loading new velocity components for the N81 display, and it is computed near the start of "CSI/B1". Has CDH in P33/73.
- DELVEET2: Vector velocity change required for the CDH burn, scale factor B7, units meters/centi-second, computed in "CDHMVR". It can be superseded in "P33/P73B" by loading new velocity components for the N81 display. The value of the quantity may also be displayed in "P32/P72C" (in local vertical coordinates) as originally derived (i.e. not modified due to manual writeover, if any, of DELVEET1 information).
- DELVEET3: Vector velocity increment required to perform maneuver, computed in "INITVEL7" (as  $\underline{V}_{iprime} \underline{V}_{init}$ ). When exit from "INITVEL7", scale factor is B7, units meters/centi-second. A new value is computed in "S34/35.3" from local-vertical inputs if required. DELVSIN same cell.

DELVLVC: See Burn Control.

DIFFALT: Difference in altitude between passive and active vehicles at CDH time (negative if active above passive vehicle), scale factor B29, units meters, computed in "CDHMVR". It is displayed in R1 of N75.

DVLOS: See Burn Control.

DVPREV: Previous value of DELVCSI, scale factor B7, units meters/centisecond.

ECC: See Conic Routines.

ELEV: Value of elevation angle between the active/passive vehicle line of sight and the active vehicle local horizontal at TPI ignition time, referenced to the direction of flight, scale factor BO, units revolutions (in range O degrees to 360 degrees). An input value of O in P34/P74 causes the angle to be derived from the specified time; a non-zero value causes the TPI time to be derived (in the routine beginning at "S33/34.1").

GAMPREV: Previous value of PCDGAMMA, scale factor B1, units revolutions.

GEOMSGN: See Conic Routines. The magnitude of the number is not significant (provided non-zero), but only the sign: the magnitude loaded in "INITVEL2", for programming convenience, is the most significant half of K (see Orbital Integration).

HAFPAl: Value of half the period of the active vehicle after completion of the CSI maneuver, scale factor B28, units centi-seconds, computed in "CSI/Bl". It is used in "CIRCL" to determine  $T_{\rm cdh}$  and  $T_{\rm csi2}$ .

- INTIME: Communication cell with "INITVEL" containing the time tag of the state vector in  $\underline{R}_{\text{init}}$  and  $\underline{V}_{\text{init}}$ , scale factor B28, units centi-seconds. Not required if VTARGTAG = 0.
- ITCTR: Single precision counter, scale factor Bl4, of the number of iterations of "INITVEL" computations which have been performed. It is set to an initial condition of -1, so that a value of +1, for example, would mean that 2 passes thru "LAMBERT" and "INTEGRVS" are performed, with the output of "LAMBERT" used in the "INTEGRVS" routine to refine the target position. The desired number of iterations is specified by the contents of VTARGTAG.
- K<sub>600sec</sub>: See Orbital and Rendezvous Navigation.
- Kalarmtb (i = 0 6): Set of single precision octal constants, program notation (i = 0) "ALARM/TB", used in "ALMXIT" to specify the alarm pattern based on (CSIALRM 1). Value of constants is equal to (600, + i): if CSIALRM = 3, for example, then alarm 602, is provided. Alarm 600, is generated in "CIRCL" if PDC2 negative on first pass (LOOPCT = 1), meaning no intersection of desired TPI LOS with the necessary circle (this is the only alarm not buffered via "SCNDSOL", see CSIALRM); Alarms 601, -604, are generated at the end of "CIRCL" for CSI periapsis too small, CDH periapsis too small, TITOT2 too small, and T2TOT3 too small respectively (604, also generated at start of "CIRCL" if T greater than T ); Alarm 605, is generated near the start of "CSI/BI" if LOOPCT is not less than K copmx; and Alarm 606, is generated at same point if DELVCSI magnitude excessive and bit 15(S32.1F1) of FIGWRD11 = 1.
- $^{\rm K}$ cs359p: Constant, program notation "CS359+", scale factor Bl, octal value 17777, 37776, corresponding to a true value of  $(1-2^{-26})$ . Used in "CSI/Bl" to set CSTH for "TIMETHET", so as to compute the period of the orbit (see  $^{\rm K}$ sn359p), i.e. an angle of ~360°.
- $m K_{delmaxl}$ : Constant, program notation "DELMAX1", scale factor B7, units meters/centi-second. Value is 0.6096 x  $2^{-7}$ , corresponding to 200 x 0.3048 x  $10^{-2}$  x  $2^{-7}$ , where first term is value in fps, second converts to meters, third converts to centi-seconds, and 4th is scale factor.
- $\rm K_{dvmaxl}$ : Constant, program notation "DVMAX1", scale factor B7, units meters/centi-second. Value is 3.048 x  $2^{-7}$ , corresponding to 1000 x 0.3048 x  $10^{-2}$  x  $2^{-7}$ , where first term is value in fps, second converts to meters, third converts to centi-seconds, and 4th is scale factor.
- $K_{
  m dvmax2}$ : Constant, program notation "DVMAX2", scale factor B7, units meters/centi-second. Value is 3.014472 x  $2^{-7}$ , corresponding to 989 x 0.3048 x  $10^{-2}$  x  $2^{-7}$ , where first term is value in fps, second converts to meters, third converts to centi-seconds, and 4th is scale factor.
- $K_{\rm eeps}$ : Constant, program notation "ELEPS", scale factor BO, units revolutions. Value is 0.2777777E-3, corresponding to 0.1°.
- Kepsfour: Constant, program notation "EPSFOUR", scale factor BO, units revolutions. Value is 0.0416666666, corresponding to 15°.

- <sup>K</sup>epsilnl: Constant, program notation "EPSILN1", scale factor B7, units meters/centi-second. Value is  $3.048E-4 \times 2^{-7}$ , corresponding to  $0.1 \times 0.3048 \times 10^{-2} \times 2^{-7}$ , where first term is value in fps, second converts to meters, third converts to centi-seconds, and 4th is scale factor.
- Kfifpsdp: Constant, program notation "FIFPSDP", scale factor B7, units meters/centi-second. Value is  $-0.1524 \times 2^{-7}$ , corresponding to  $-50 \times 0.3048 \times 10^{-2} \times 2^{-7}$ , where first term is value in fps, second converts to meters, third converts to centi-seconds, and 4th is scale factor.
- Kinitst: Constant, program notation "INITST", scale factor B7, units meters/centi-second. Value is 0.03048 x  $2^{-7}$ , corresponding to 10 x 0.3048 x  $10^{-2}$  x  $2^{-7}$ , where first term is value in fps, second converts to meters, third converts to centi-seconds, and 4th is scale factor.
- Kinitstl: Constant, program notation "INITSTL", scale factor B7, units meters/centi-second. Value is 0.03048 x 2-7, the same as Kinitst. Stored in a separate memory cell in "high" part of memory because of memory allocation constraints (and interpretive language limitations).
- K : Constant, program notation "LOOPMX", scale factor B28. Octal value is 00000, 00020, corresponding to decimal 16 (giving an error exit from the start of "CSI/B1" after 15 complete iterations done).
- $^{\rm K}$  max250: Constant, program notation "MAX250", scale factor B28, units centi-seconds. Value is 25E3 x 2^-28, corresponding to 250 seconds.
- $^{\rm K}$ nickeldp: Constant, program notation "NICKELDP", scale factor B7, units meters/centi-second. Value is 0.021336 x 2-7, corresponding to 7 x 0.3048 x  $10^{-2}$  x  $2^{-7}$ , where first term is value in fps, second converts to meters, third converts to centi-seconds, and 4th is scale factor. Value of constant originally corresponded to 0.05 fps, hence the notation.
- $^{\rm K}$  onethth: Constant, program notation "ONETHTH", scale factor B3, value 0.0001 x  $2^{-3}$  (first term is basic value and second scale factor).
- K : Constant, program notation "PMINE", scale factor B29, units meters, o giving the minimum periapsis value (POSTCDH and POSTCSI) for earthcentered computations. Value is  $157420 \times 2^{-29}$ , corresponding to 85 x  $1852 \times 2^{-29}$ , where first term is value in nmi, second converts to meters, and third is scale factor.
- K : Constant, program notation "PMINM" (stored at "PMINE" + 8), scale 8 factor B29, units meters, giving the minimum periapsis value for moon-centered computations. Value is 10668 x 2<sup>-29</sup>, corresponding to 35000 x 0.3048 x 2<sup>-29</sup>, where first term is value in feet, second converts to meters, and third is scale factor.
- K<sub>rpad</sub>: See Burn Control.
- K sn359p: Constant, program notation "SN359+", scale factor Bl, value sn359p: -0.00008660l. True value is -0.000173202, or approximately sin 359.99°: see K cs359p°

- K twopi: Constant, program notation "TWOPI", scale factor B4, value 6.283185307 x  $2^{-4}$ , corresponding to  $2\pi$  (where  $\pi$  = 3.1415926535).
- LMYDOT: See Burn Control.
- LOOPCT: Iteration counter for "CSI/A" computations, initialized to 0 in "CSI/A" and "SCNDSOL", scale factor B28.
- NN1: Value of "periapsis code" displayed by Rl of N55, scale factor Bl4, program notation also "NN". Used in P31/P32/P72 (where initialized to 1 prior to N55 display) to specify the future apsidal crossing of the active vehicle at which CDH should occur. Used in "P82" in the control of Minkey program sequencing, although the attempted "countdown" of the cell there is ineffective since bit 6(CSISFLAG) of FIGWRD11 = 0. Used in P34/P74 to specify the number of precision offsets that the "INITVEL" package should employ (it is initialized to 0 in "P74" and used in "S3435.25"). The P34/P74 value would be used for the subsequent P35/P75 performance. The identification as "periapsis code" is a holdover from the former P17 application.
- NOMTPI: Value of computed correction to T<sub>tpi</sub>, scale factor B28, units centi-seconds, loaded in "ELCALC". This scheme permits  $\frac{R}{aprec}/\frac{R}{pprec}$  state vector time tag to remain T<sub>tpi</sub> while the iteration continues for the proper updated value of T<sub>tpi</sub>, using conic integration.
- P: See Conic Routines.
- PCDGAMMA: Error angle used in the "CSI/A" computations, scale factor Bl, units revolutions, stored in push-down list location OD. It is the central angle between the passive vehicle position vector at TPI and PDUB.
- PCDK: Value of "weight" for PDUL in computing PDUB, scale factor B29, units meters, corresponding to the lesser (in magnitude) of PCDK1 and PCDK2. Stored in push-down location 10D.
- PCDK1: Value corresponding to one of the solutions of the equation for PCDK, scale factor B29, units meters, stored in push-down location 12D. Equation solved for "k" is:  $k^2 + 2c_1 k + r_{a3}^2 r_{p3}^2 = 0$ .
- PCDK2: Value corresponding to the other solution of the quadratic equation for PCDK, scale factor B29, units meters, stored in push-down location lOD (written over with PCDK1 if necessary to determine PCDK).
- PDO2R: Value of magnitude of passive vehicle position vector used in "CDHMVR" to compute DIFFALT, scale factor B29, units meters. Stored in push-down location O2D (cell contents replaced by magnitude of  $\underline{R}_{act2}$  after use).
- PD18<u>V</u>: Value of passive vehicle velocity vector used in "CDHMVR", scale factor B7, units meters/centi-second. It is the velocity vector at the point corresponding to PDO2R(i.e. radially above/below the active vehicle), and is stored in push-down location 18D.
- PD28CS: Value of ratio of active to passive vehicle radius magnitudes times cos ELEV (i.e. times cos ( $\frac{1}{2}$  ELEV)), scale factor Bl, stored in push-down list location 28D.
- PDALFMPI: Value of guidance equation quantity  $\alpha$  minus  $\pi$ , scale factor BO, units revolutions, stored in push-down list location 18D.

- PDC1: Value of equation quantity "c\_" (see PCDK1) for quadratic equation in "CIRCL", scale factor B29, units meters, stored in push-down location 6D.
- PDC2: Value of equation quantity "c2" (the quantity under the radical for the quadratic equation defined in PCDK1 definition), scale factor B58, units meters<sup>2</sup>; square root stored temporarily in push-down list.
- PDDELTM: Value of guidance equation quantity & t, scale factor B28, units centi-seconds, stored in push-down list location 12D.
- PDOMEGA: Value of active vehicle angular velocity information times radius magnitude ratio (for convenience in scaling), scale factor B37, stored temporarily in push-down list. Push-down(16D) list subsequently modified to contain PDOMEGA PDOMEGP, with scale factor information in Xl also (i.e. scaling B(37 +X1)).
- PDOMEGP: Value of passive vehicle angular velocity information times radius magnitude ratio (for convenience in scaling: the reciprocal of the ratio used for PDOMEGA is employed), scale factor B37, stored as described under PDOMEGA.
- PDSEMAA: Value of semi-major axis of active vehicle computed in "CDHMVR", scale factor B29, units meters, stored in push-down location 4D.
- PDSEMAP: Value of semi-major axis of passive vehicle computed in "CDHMVR", scale factor B29, units meters, stored temporarily in push-down location 4D (then that location used for PDSEMAA).
- PDSL: Value of "slope" function for "CIRCL" iteration (DELDV for next cycle is given by PCDGAMMA / PDSL), scale factor B-6 (for variables already normalized), stored in push-down location 4D.
- PDUB: Value of equation "b" vector, scale factor Bl, stored in push-down location OD. It represents the position where the passive vehicle "should be based on the active vehicle location", and is used to compute PCDGAMMA.
- PDUL: Value of equation "u\_" vector, scale factor Bl, stored in push-down location OD. It gives the "unit vector which passes through the active vehicle position and is coincident with the desired TPI line of sight" (specified by ELEV).
- PDVAH: Value of "horizontal" component of required active vehicle velocity after CDH maneuver, computed in "CDHMVR". Scale factor is B7, units meters/centi-second, and stored in push-down location 10D.
- PDVAV: Value of "vertical" (i.e. radial) component of required active vehicle velocity after CDH maneuver, computed in "CDHMVR". Scale factor is B7, units meters/centi-second, and stored in push-down location 8D.

- POSTCDH: Value of periapsis altitude after performance of CDH maneuver, scale factor B29, units meters. It is computed in "CIRCL" for use at end of iteration to check that the 85 nmi/35,000 feet minimum value constraint not violated. It is not computed in P33/P73.
- POSTCSI: Value of periapsis altitude after performance of CSI maneuver, scale factor B29, units meters. It is computed in "CSI/B1" for use at end of iteration to check that minimum value constraint not violated.
- $\underline{R}_{actl}$ : Value of active vehicle position vector, scale factor B29, units meters, initialized in "ADVANCE" to be equal to the active vehicle vector at the specified  $\underline{T}_{i}$  ( $\underline{T}_{csi}$  or  $\underline{T}_{cdh}$ ), rotated into the plane of the passive vehicle. Loaded near end of "P32/P72C" with  $\underline{R}_{act2}$  to permit use of a common subroutine.
- $\underline{\underline{R}}_{act2}$ : Value of active vehicle position vector, scale factor B29, units meters. Initialized in "ADVANCE" to  $\underline{\underline{R}}_{act1}$ , and written over in "CIRCL" with computed CDH state vector. The quantity is used in "CDHMVR" as the active vehicle position vector at CDH.
- Ract3 : Value of active vehicle position vector, scale factor B29, units meters. Computed in "PRECSET" for the input-specified time, and used in "ADVANCE" for initializing active vehicle vectors at that time. Is updated in "CIRCL" to be the active vehicle position vector at TPI time: this is also the meaning of the quantity in P34/P74, for example. A similar update is done in "P33/P73B".
- $\frac{R}{\text{aprec}}: \text{Value of } \frac{R}{\text{act3}} \text{ at entrance to "S33/34.1", used to form a standard initial condition for performance of conic integration in "ADTIME+3" by the amount of time in NOMTPI (to avoid buildup of error due to successive conic computations), scale factor B29, units meters.}$
- Rinit: Value of position vector at start of burn (or of Lambert evaluation), used as a communication cell with "INITVEL", scale factor B29, units meters. "INITVEL" scales to B27 if moon-centered. If iteration is required, the time tag for the state vector is in INTIME.
- $\frac{R}{Passl}$ : Value of passive vehicle position vector, scale factor B29, units meters, initialized in "ADVANCE" to be equal to the passive vehicle position vector at the specified  $T_{ig}$  ( $T_{csi}$  or  $T_{cdh}$ ).
- $\frac{R}{pass2}$ : Value of passive vehicle position vector, scale factor B29, units meters, initialized in "ADVANCE" to  $\frac{R}{pass2}$ . It is written over in "CIRCL" with the computed passive vehicle state vector at CDH, and it is used in "CDHMVR" as the passive vehicle state vector then.
- Pass3: Value of passive vehicle position vector, scale factor B29, units meters. Computed in "PRECSET" for the input-specified time, and used in "ADVANCE" for initializing active vehicle vectors at that time. Is updated in "P32/P72B" (before entrance to "CSI/A") to be the passive vehicle position vector at TPI time; a similar update is done in "P33/P73B" after CDH maneuver parameters obtained.

 $\frac{R}{pprec}$ : Value of  $\frac{R}{pass3}$  at entrance to "S33/34.1", used to form a standard initial condition for performance of conic integration in "ADTIME+3", scale factor B29, units meters (see  $\frac{R}{aprec}$ ).

Rtarg: Communication cell with "INITVEL" containing position of target vector (or vehicle) DELLT4 centi-seconds after the time in INTIME, scale factor B29, units meters. Loaded with updated target vector position (if a change made) before exit from routine.

 $\frac{R}{targl}$ : Value of  $\frac{R}{targ}$  used within "INITVEL" package, scale factor (after rescaling) B29(earth) or B27(moon), units meters. B29 when exit.

R1: See Conic Routines.

R1VEC, R2VEC: See Conic Routines.

RCV: See Orbital Integration.

RdA: See Conic Routines.

RDOTV: Value of  $\underline{R}_{actl}$  •  $\underline{V}_{act4}$  computed in "CSI/B1", scale factor B36, units meters<sup>2</sup>/centi-second.

RLS: See Coordinate Transformations.

RTMU, RTSRldMU: See Burn Control.

RTX1, RTX2: See Orbital Integration (cells loaded at start of most P3i/P7i programs with index information for X1 and X2 respectively, selecting earth if -2 and 0; moon if -10 and 2).

RVEC: See Conic Routines.

SECMAX: Value of maximum time increment used in iteration for TPI time, scale factor B28, units centi-seconds. Initialized to K in "S33/34.1".

SNTH: See Conic Routines.

SUBEXIT: Single precision cell used to retain return address information from "S34/35.2".

T: See Conic Routines.

Tcdh: Value of ignition time for CDH maneuver, scale factor B28, units centi-seconds. It is derived in "CIRCL", and displayed by N13.

 $^{\rm T}{\rm csi}$ : Value of ignition time for CSI maneuver, scale factor B28, units centi-seconds, loaded via N11 at start of P31/P32/P72. Loaded with  $^{\rm T}{\rm csi2}$  in "P82".

 $^{\rm T}$ csi2: Value of ignition time for subsequent CSI maneuver computed in "CIRCL", scale factor B28, units centi-seconds, loaded into  $^{\rm T}$ csi in "P82".

 $^{\mathrm{T}}\mathrm{dec2}$ : Value of time to which integration is to be performed by "PRECSET", scale factor B28, units centi-seconds. Used to achieve the same  $^{\mathrm{T}}\mathrm{dec1}$  setting for the CSM integration as for the LM integration.

- Tet: See Orbital Integration.
- T<sub>pass4</sub>: See Burn Control.
- Ttpi: Value of Transfer Phase Initiation (TPI) time, scale factor B28, units centi-seconds. Can be input to P34/P74 from e.g. P33/P73 derived value, although it can also be computed in P34/P74 to give a specified elevation angle value. If it is to be derived, the iteration starts in P34/P74 with the specified Ttpi.
- T1TOT2: Value of time interval for P32/P72 between T and T computed at the end of "CIRCL", scale factor B28, units centi-seconds. To permit display in R2 of N75, made modulo one hour in "P32/P72C". In P33/P73, it is the time interval between T and T computed in "P33/P73B", and made modulo one hour only if positive).
- T2TOT3: Value of time interval between  $T_{\rm cdh}$  and  $T_{\rm tpi}$  for P32/P72, scale factor B28, units centi-seconds, displayed in R3 of N75. It is derived in "CIRCL" but loaded in "P32/P72C", where made modulo one hour. In P33/P73, it is the value of  $(T_{\rm tpi} T_{\rm tpi})$ , the change in TPI time between P32/P72 and P33/P73, computed in P33/P73B", where it is also made modulo one hour.
- TDESIRED: See Conic Routines.
- TITER: Single precision cell used in "S33/34.1" to protect against excessive iterations. Initialized to a negative number, and then reset in "ELCALC" (where used as flag for first pass) to 377778. Subsequently shifted right 1 place if DELEL not less than K eeps: the 15th right shift will make the single precision value zero (double precision one non-zero, serving as error flag), causing an error exit.
- ULOS: Value of unit vector, scale factor Bl, in line-of-sight direction (direction of  $\frac{R}{pass3} \frac{R}{act3}$ ).
- UN: See Conic Routines. Computed in "INITVEL" as perpendicular to plane defined by  $\underline{R}_{\text{init}}$  and  $\underline{V}_{\text{init}}$ , but is written over in Lambert routine (in subroutine "GEOM") if the NORMSW (bit 10 of FLAGWRD7) is 0 (meaning that transfer not too close to 180 degrees as defined by COZY4 information).
- UNRM: Value of unit vector, scale factor Bl, perpendicular to  $\underline{R}_{act3}$  and  $\underline{V}_{act3}$  (i.e. in  $\underline{R}$  \*  $\underline{V}$  direction).
- UNVEC: Unit vector formed from  $\underline{R}_{act2}$  at the start of "CDHMVR", scale factor Bl.
- UP: Unit vector, scale factor Bl, giving direction of "local horizontal plane of active vehicle at  $T_{\rm tp}$ " for use in computing ELEV in "ELCALC", stored in push-down list location OD.
- UP1: Unit vector, scale factor B1, computed in "PRECSET" in direction of  $\frac{r}{p} * \frac{v}{p}$  (the passive vehicle position and velocity vectors at the specified ignition time).

- $\underline{\underline{V}}_{act2}$ : Value of active vehicle velocity vector, scale factor B7, units meters/centi-second. Initialized in "ADVANCE" to  $\underline{\underline{V}}_{act1}$ , and written over in "CIRCL" with computed CDH state vector. The quantity is used in "CDHMVR" as active vehicle velocity vector at CDH.
- Value of active vehicle velocity vector, scale factor B7, units meters/centi-second. Computed in "PRECSET" for the input-specified time, and used in "ADVANCE" for initializing active vehicle vectors at that time. It is loaded at the end of "CDHMVR" with the required velocity after the CDH maneuver, and this value in "CIRCL" in turn is written over with the active vehicle velocity at TPI (which is also the meaning of the quantity in P34/P74). A similar writeover is done in "P33/P73B".
- $\underline{V}_{act4}$ : Value of active vehicle velocity vector, scale factor B7, units meters/centi-second, after performance of CSI maneuver (computed in "CSI/B1").
- $\underline{V}_{\rm aprec}$ : Value of  $\underline{V}_{\rm act3}$  at entrance to "S33/34.1", scale factor B7, units meters/centi-second (see  $\underline{R}_{\rm aprec}$ ).
- Value of velocity vector at start of burn (or of Lambert evaluation), used as a communication cell with "INITVEL", scale factor B7, units meters/centi-second. "INITVEL" scales to B5 if moon-centered. If iteration is required, the time tag for the state vector is in INTIME.
- Value of required velocity computed by Lambert routine (i.e. VVEC value when return from routine) at the time INTIME. Scale factor B7 (earth) or B5(moon), units meters/centi-second. Rescaled if moon-centered to B7 before exiting from "INITVEL7".
- $\underline{V}_{passl}$ : Value of passive vehicle velocity vector, scale factor B7, units meters/centi-second (see  $\underline{R}_{passl}$ ).
- $\frac{V}{\text{pass2}}$ : Value of passive vehicle velocity vector, scale factor B7, units meters/centi-second (see  $\frac{R}{\text{pass2}}$ ).
- V : Value of passive vehicle velocity vector at the start of the pass3 burn of interest (e.g. TPI burn), scale factor B7, units meters/centi-second (loaded in several cases in "PRECSET"). See R pass3.
- $\frac{V}{pass4}$ : Value of passive vehicle velocity vector at intercept (T pass4) time, scale factor B7, units meters/centi-second.
- $\frac{\text{V}}{\text{pprec}} : \text{Value of } \frac{\text{V}}{\text{pass3}} \text{ at entrance to "S33/34.1", used to form a standard initial condition for performance of conic integration in "ADTIME+3", scale factor B7, units meters/centi-second (see <math>\frac{\text{R}}{\text{aprec}}$ ).

- Vtarget: Value of active vehicle velocity at intercept (after doing the burn), scale factor B7(earth) or B5(moon), units meters/centisecond. If VTARGTAG is non-zero, value computed by precision integration in "INITVEL2"; if VTARGTAG is O, value computed by "INITV" at the end of Lambert iteration.
- $\underline{V}_{\text{tprime}}$ : Value of  $\underline{V}_{\text{target}}$  when return from "INITVEL" routine, scale factor B7, units meters/centi-second (rescaled from B5 if moon-centered in "INITVEL7").

VCV: See Orbital Integration.

VTARGTAG: Single precision cell, scale factor Bl4, used to store the required number of Lambert iterations. Information originally set in push-down list location OD (called  $TS_1$  in programmed equations), with a value of zero meaning that no iterations are required (hence  $\underline{V}_{target}$  computed by "INITV" and target vector information, barring the effects of COZY4, remains unchanged).

VVEC: See Conic Routines.
XXXALT: See Burn Control.

#### Quantities in Computations

See also list of major variables and list of routines

- ALPHAV: See Coordinate Transformations.
- BETAl: Intermediate quantity computed near start of "V2T100", scale factor Bl, equal to (1 + X0FT2<sup>2</sup>), i.e. reciprocal of square of sine of post-return flight path angle.
- BETA4: Intermediate quantity computed in "PREC125", stored in push-down list, scale factor Bl.
- BETA5: Intermediate quantity computed near start of "V2T100", scale factor variable (1 + LAMBDA scale factor), stored in push-down list location 28D. Complement of LAMBDA scale factor is (X1 -1).
- BETA6: Intermediate quantity computed in "V2T100", scale factor B17, stored in push-down list location 16D (as a triple precision quantity).
- BETA9: Intermediate quantity computed in "GAMDV50", scale factor B5, stored in push-down list location 24D.
- BETAl2: Intermediate quantity computed in "PREC125", scale factor Bl. Quantity in program is the complement of that in the equation documentation, so that its sign can also be used to reflect the equation function performed by  $\phi_4$ , the "precision trajectory direction switch."
- Cemdot: See Steering Computations.
- C : Single precision erasable memory constant, program notation p37range"P37RANGE", scale factor BO, units revolutions: multiply by 21600 to convert to nautical mile scale compatible with constants used in "AUGEKUGL". If non-zero, writes over PHIE in "RTEVN".
- $^{\rm C}$  rtedl: Erasable memory (double precision) constant, program notation "RTEDl", scale factor B3, giving the bias term value used in "RTE360" to compute desired "final cotangent of the flight path angle" (other terms use  $\rm K_{rtdi}$  in fixed memory).
- CFPA: Cosine of initial flight path angle (before application of any thrust), scale factor Bl, computed near start of "P37".
- COGA: See Conic Routines.
- CONICX1: Single precision cell, scale factor Bl4, initialized to a value of 2 near start of "P37" and used to set index register Xl for proper interface with conic routines. Xl is set to CONICX1, which is, of course, -2 (signifying to conic routines that selection of earth as central body is required).
- CSTH: See Conic Routines.
- DELVEET3: See Rendezvous Computations (used in "VN1645" for velocity increment information). Program notation also "DELVSIN".
- DELVLVC: See Burn Control.

- DRCON: "Change in the final radius of a conic trajectory," scale factor B29, units meters, used in iterator computation to obtain a new value for RCON.
- DT21: Value of "adjustment" to T<sub>2</sub> in "PREC125" to obtained desired final radius, scale factor B28, units centi-seconds, stored in push-down list location OD.
- DT21PR: Value of previous DT21, same scaling, initialized to +MAX, i.e. (2<sup>28</sup> 1) centi-seconds, near start of "PREC100".
- DV: Magnitude of required velocity change at ignition time computed in "DVCALC", scale factor B7, units meters/centi-second.
- DVPR: Value of previous DV loaded in "GAMDV25", same scaling, stored in push-down list location 20D.
- DXOFT1: Value of change in XOFT1, scale factor B5, initialized in "V2T140" or "V2T145" and updated in "V2T150". Stored in push-down list location 16D. Updating actually in "GAMDV35" computation entered from "V2T150".
- DXT1MAX: Value of maximum allowed change in DXOFT1, scale factor B5, stored in push-down list location 12D.

ECSTEER: See Burn Control.

ERADM: See Coordinate Transformations.

GAMMAEI: Flight path angle loaded and displayed in R3 of noun 60, scale factor B0, units revolutions. Used initially at start of "P37" to specify desired flight path angle (loaded into RTEGAM2D), and subsequently loaded in "RTEVN" with derived value of the angle for display purposes. See also Display Computations.

GAMTERM: See Display Computations.

- $^{\rm K}_{\rm 304rt}$ : Constant, program notation "30480RTE", scale factor B29, units meters. Value is 30480 x 2^-29, corresponding to 30480 meters or 100,000 feet.
- $^{\rm K}$  c4rte: Constant, program notation "C4RTE", scale factor B30, value  $-6.986643{\rm E7}$  x  $2^{-30}$ , corresponding to  $-6.986643{\rm E7}$  meters. Used near start of "P37" to initialize MAMAX1.
- K<sub>csubt</sub>: Constant, program notation "CSUBT", scale factor BO, value 0.5.
- Ke3rte : Constant, program notation "E3RTE", scale factor B29, units meters. Value is 121920 x 2-29, corresponding to 121920 meters or 400,000 feet.
- $^{\rm K}$  epcl. Constant, program notation "EPClRTE", scale factor B1, value 0.99966 x 2<sup>-1</sup>. Value corresponds to cosine 1.5°.
- $^{\rm K}{\rm epc2}:$  Constant, program notation "EPC2RTE", scale factor B29, units meters. Value is 100 x 2 $^{-29}$ , corresponding to 100 meters.

- ${\rm K_{epc3}}:$  Constant, program notation "EPC3RTE", scale factor BO, value 0.001.
- $\rm ^Kepc4$  : Constant, program notation "EPC4RTE", scale factor BO, value 0.00001.
- $^{\rm K}{\rm epc6}^{\rm :}$  Constant, program notation "EPC6RTE", scale factor Bl, value  $^{\rm K}{\rm epc6}^{\rm :}$  E=6 x 2<sup>-1</sup>, corresponding to 7E-6.
- $^{\rm K}$  epc7: Constant, program notation "EPC7RTE", scale factor B29, value 1000 x 2-29, corresponding to 1000 meters.
- Kepc8: Constant, program notation "EPC8RTE", scale factor BO, value 0.002.
- <sup>K</sup>epc9: Constant, program notation "EPC9RTE", scale factor B5, value  $\times$  2-25. Corresponds to a "true value" of 2-20 (about 0.953674E-6).
- $^{
  m K}$ epclo: Constant, program notation "EPClORTE", scale factor B7, units meters/centi-second. Value is 0.0001 x  $2^{-7}$ , corresponding to 0.01 meter/second.
- $\rm K_{klrte}$ : Constant, program notation "KlRTE", scale factor B29, units meters. Value is 7E6 x 2<sup>-29</sup>, corresponding to 7E6 meters.
- $m K_{k2rte}$ : Constant, program notation "K2RTE", scale factor B29, units meters. Value is 6,495,000 x  $2^{-29}$ , corresponding to 6.495E6 meters, used in "P37" to initialize RCON. Value is 258 meters less than 400,000 feet above standard pad radius (of 6,373,338 meters).
- $\rm ^Kk3rte$  : Constant, program notation "K3RTE", scale factor BO, value -0.06105, corresponding to sin (-3.5°).
- $K_{k4rte}$ : Constant, program notation "K4RTE", scale factor BO, value -0.10453, corresponding to sin (-6.00).
- $^{\rm K}_{\rm mcs7p5}$ : Constant, program notation "MCOS7.5", scale factor BO, value  $^{\rm COS7p5}$  -0.99144486, corresponding to cos 7.5°.
- $^{K}$  mcs22p5: Constant, program notation "MCOS22.5", scale factor B2, value  $^{-0.92387953}$  x 2 $^{-2}$ , corresponding to  $^{-}$  cos 22.5°.
- Kmdtrc: Constant, program notation "MDOTRCS", scale factor B3, units kilograms/centi-second, giving mass flow rate for single jet RCS (doubled for 2 jets, doubled again for 4 jets). Value is 0.0016375 x 2-3, corresponding to 0.16375 kg/sec or about 0.361 pound/sec: this gives, multiplying by 276 (see Kvcrcs), thrust of about 99.6 lbs.
- K constant, program notation "MSIN7.5", scale factor BO, value -0.13052619, corresponding to sin 7.5°.

 $^{\rm K}$ p37ei (i = 0-2): Coefficients of power series expansion used in "P37E" to approximate (l - e $^{-\rm x}$ ). Coefficients imbedded in coding (due to calling sequence of polynomial routine), with first one at "P37T +5". Values are:

i	Scale Factor	Value Loaded
0	B3	$5.66240507E-4 \times 2^{-3}$
1	Bl	9.79487897E-1 x <sub>2</sub> -1
2	B-1	$-0.388281955 \times 2^{1}$

K<sub>rtci</sub> (i = 0-3): Coefficients of power series expansion used in "P37" to compute required value of MAMAX2. Coefficients imbedded in coding (due to calling sequence of polynomial routine), with first one at "RTE320 -14". Values are:

i	Scale Factor	Value Loaded	Binary Equivalent
0	B31	181,000,434 x 2 <sup>-31</sup>	181,000,432
1	B2	$1.50785145 \times 2^{-2}$	1.5078514516
2	B-27	-6.49993057E-9 x 2 <sup>27</sup>	-6.4999305660E-9
3	B-56	9.76938926E-18 x 2 <sup>56</sup>	9.7693892759E-18

K<sub>rtdi</sub> (i = 1-4): Coefficients of power series expansion used in "RTE360" to compute XOFT2ERR if RTEGAM2D = 0. Coefficients imbedded in coding (due to calling sequence of polynomial routine), with first one at "RTE369 +5". Values are (note velocity in meters/centisecond in program):

i	Scale Factor	Value Loaded
1	B3	O (C <sub>rtedl</sub> is used for "bias" value)
2	B-4	$-4.8760771E-2 \times 2^4$
3	B-11	4.5419476E-4 x 2 <sup>11</sup>
4	B-18	-1.4317675E-6 x 2 <sup>18</sup>

K constant, program notation "RTMURTE", scale factor B18, value 199650.501 x  $2^{-18}$ . Corresponds to the square root of about 3.98603225E10, roughly the earth  $\mu$  in units of meters  $^3$ /centi-sec  $^2$ .

 $\rm ^{K}_{\rm thl65}:$  Constant, program notation "THETA165", scale factor BO, units revolutions. Value is 0.458333333, corresponding to 165°.

 $K_{\rm th210}$ : Constant, program notation "THETA210", scale factor BO, units revolutions. Value is 0.583333333, corresponding to 210°.

 $^{\rm K}$  vcrcs: Constant, program notation "VCRCS", scale factor B5, units meters/centi-second, giving exhaust velocity for RCS. Value is 27.0664 x 2^-5, corresponding to 2706.64 meters/second (an I sp, dividing by 9.80665, of 276.0 seconds).

- K constant, program notation "VCSPS", scale factor B5, units meters/centi-second, giving exhaust velocity for SPS. Value is 31.510396 x  $2^{-5}$ , corresponding to an exhaust velocity of 3151.0396 meters/second. See K in Steering Computations.
- LAMBDA: Ratio of  $\frac{R_{tl}}{RCON}$  computed in "V2TlOO", scale factor given by (1 X1), stored in push-down list location OD.
- LAT, LONG: See Coordinate Transformations.
- LATSPL: Value of predicted latitude of target computed in "RTEVN", scale factor BO, units revolutions. Also used in same routine for temporary storage of cos PHIE, scale factor Bl.
- LNGSPL: Value of predicted longitude of target computed in "RTEVN", scale factor BO, units revolutions. Also used in same routine for temporary storage of sin PHIE, scale factor Bl.
- MAMAX1: Value of "maximum allowable major axis of return trajectories with a negative radial component", scale factor B30, units meters. Initialized to  $K_{\rm chrte}$  near start of "P37".
- MAMAX2: Value of "maximum allowable major axis of return trajectories with a positive radial component", scale factor B30, units meters. Computed as a polynomial function of  $\lfloor \underline{\mathbb{R}}_{+,1} \rfloor$  in "P37".
- MASS: See Digital Autopilot Interface Routines.
- NNIA: Counter used to protect against excessive iterations in the computations, and also for computation control purposes. It is initialized to -9 in "P37" and incremented by 1 in "RTE360": when the increment causes the cell to be 0 (or positive), then alarm 0605 is generated. The negative sign is used as a flag that the conic portion of the computation is being executed. After completion of the conic displays, NNIA is set to +10 in "PREC100" and decremented by 1 in "PREC210". Scale factor of counter is B28.
- NN2: Counter used to protect against excessive iterations in computations on loops internal to those protected by NN1A, scale factor B28. It is initialized to -144 in "GAMDV10" and incremented (with checks for reaching a O value) in "GAMDV25". It is also used in "PREC100", where initialized to -15 and subsequently incremented in "PREC125" to monitor for iterations to compute flight path angle.
- OPTION1, OPTION2: See Display Interface Routines.
- P: See Conic Routines.
- PCON: Value of "semi-latus rectum of a conic trajectory" computed in "DVCALC", scale factor B28, units meters.
- PD33: Single precision exit address from "V2T100", corresponding to push-down list location 33D.
- PdRPRE: Value of P (ratio of semi-latus rectum to magnitude of  $\underline{R}_{t2}$ ) loaded in "PREC125", scale factor B4, stored in push-down list location 26D.

PHI2: Indicator set to +1 to indicate a solution near apogee and to -1 to indicate a solution near perigee. Cell set near start of "P37E", with scale factor B2.

PHIE: See Display Computations.

 $\underline{R}_{\text{tl}}$ : Value of position vector at time "l" (i.e. time of ignition), scale factor B29, units meters. Loaded in "P37", with program notation "R(T1)/".

 $\underline{R}_{t2}$ : Value of position vector at time "2" (i.e. at final position for entry), scale factor B29, units meters. Program notation "R(T2)/".

 $\underline{R}_{targ}$ : See Rendezvous Computations.

Rl: See Conic Routines.

RCON: Value of conic radius magnitude, scale factor B29, units meters. Initialized to  $K_{\rm k2rte}$  in "P37", and updated in "PREC175" and "RTE360".

RCONPR: Value of radius magnitude computed in "RTE360" as K stored in Fischer ellipse value, scale factor B29, units meters. Stored in push-down list address 2D.

RCV: See Orbital Integration.

RD: Value of magnitude of final position vector desired, scale factor B29, units meters. Initialized in the beginning of "PRECLOO" to the final value of RCON resulting from the conic portion of the computation.

RdA: See Conic Routines.

RdAPRE: Value of RdA (ratio of magnitude of Rt2 to semi-major axis) loaded in "PREC125", scale factor B6, stored in push-down list location 28D.

RDESIRED: See Conic Routines.

RERR: Error in magnitude of position vector computed at the start of "PREC175", scale factor B29, units meters, stored in push-down list.

RF: Value of "final radius" magnitude computed in "PREC125", scale factor B29, units meters, stored in push-down list.

RPRE: Value of Rl (magnitude of  $\underline{R}_{t2}$ ) loaded at the start of "PREC125", scale factor B29, units meters. Stored in push-down list location 24D.

RPREPR: Value of previous RPRE, loaded in "PREC210", scale factor B29, units meters. Program notation "RPRE,".

RTEDVD: Value of desired velocity change loaded at the beginning of "P37" with the information loaded into R2 of N60, scale factor B7, units meters/centi-second. If a value of O is loaded, this means that a "minimum fuel" return computation is desired. Is R2 of N56.

RTEGAM2D: Value of desired flight path angle loaded at the beginning of "P37" with the information loaded into R3 of N6O, scale factor BO, units revolutions. If a value of O is loaded, a polynomial is used in "RTE36O" to compute desired XOFT2 data "to hit center of entry corridor" (polynomial is a function of  $\underline{V}_{+2}$  magnitude). It can be accessed by R1 of N56.

RVEC: See Conic Routines.

SGNRDOT: See Conic Routines.

SNTH: See Conic Routines.

SPRTEX: Single precision cell containing return address from "PRECLOO".

T: See Conic Routines.

 $T_1$ : Value of time tag associated with  $R_{t1}$  and  $V_{t1}$  loaded in "P37", scale factor B28, units centi-seconds.

T<sub>2</sub>: Value of time tag associated with  $\underline{R}_{t2}$  and  $\underline{V}_{t2}$ , scale factor B28, units centi-seconds. Also used for the desired time tag.

T<sub>12</sub>: Value of transfer time computed by "TMRAD100" (i.e. T from "TIMERAD"), scale factor B28, units centi-seconds.

Tent: See Display Computations.

Tet: See Orbital Integration.

Tpass4: See Burn Control.

T3TOT4: Transfer time displayed by N39, scale factor B28, units centiseconds, giving time from ignition to arrival at entry interface.

THETAl: Intermediate quantity computed in "V2TlOO" and used in "DVCALC", scale factor Bl7, stored triple precision in push-down list location 2D.

THETA2: Intermediate quantity computed in "V2T100" and used in "DVCALC", scale factor B38, stored triple precision in push-down list location 5D.

THETA3: Intermediate quantity computed in "V2T100" and used in "DVCALC", scale factor B-4, stored in push-down list location 8D (double precision).

TRKMKCNT: See Measurement Incorporation (set 0 in "P37E" to permit the "VN1645" routine to have, with zeroing of VHFCNT, a 0 R3 display).

UH: Unit "horizontal" vector computed in "P37", scale factor Bl.

Value of velocity at T<sub>1</sub> after addition of impulsive velocity increment, scale factor B7, units meters/centi-second. Loaded in "DVCALC". Program notation "V2(T1)/".

Vtl: Value of velocity at T<sub>1</sub> before addition of impulsive velocity increment, scale factor B7, units meters/centi-second. Loaded in "P37", with program notation "V(T1)/".

 $\underline{V}_{t2}$ : Value of velocity at  $\underline{T}_2$ , scale factor B7, units meters/centisecond. Program notation "V( $\underline{T}_2$ )/".

VCV: See Orbital Integration.

VGDISP: See Burn Control.

VHFCNT: See Measurement Incorporation (and comment above on TRKMKCNT).

VNSTORE: Single precision cell containing return address from "RTEVN".

VPRED: Velocity information loaded and displayed in R2 of noun 60, scale factor B7, units meters/centi-second. Used initially at start of "P37" to specify desired velocity increment (see RTEDVD), and subsequently loaded in "RTEVN" with derived value of velocity at entry interface altitude (i.e. magnitude of  $\underline{V}_{+2}$ ). See Display Comp.

VTERM: See Display Computations.

WVEC: See Conic Routines.

XOFT1: "Cotangent of the post-return flight path angle", scale factor B5 (i.e. flight path angle after application of impulsive velocity).

XOFTLMAX: Upper bound on the value of XOFTL, scale factor B5, stored in push-down list location 14D.

XOFTIMIN: Lower bound on the value of XOFT1, scale factor B5, stored in push-down list location 10D.

XOFTIPR: Value of previous XOFT1 loaded in "GAMDV25", scale factor B5, used in iterator. Stored in push-down list location 18D.

XOFTIPRP: Value of XOFT1 stored in "V2T100" (before entrance to "GAMDV10" iteration), scale factor B5. Stored in push-down list location OD.

XOFT2: "Final cotangent of the flight path angle", scale factor BO. If RTEGAM2D non-zero, initialized in "P37" to cot ( $\frac{1}{4}$  - RTEGAM2D), where " $\frac{1}{4}$ ", of course, since angles in revolutions, corresponds to 90°. Program notation "X(T2)".

- XOFT2ERP: Value of previous XOFT2ERR, scale factor BO, loaded in "RTE360". Tag for cell is "DRCON", since same cell used later for that purpose.
- XOFT2ERR: Value of error in flight path angle (O if RTEGAM2D non-zero), scale factor BO (cotangent of the angle is used, i.e. XOFT2 information). Stored in push-down list location OD.
- XOFT2PR: Value of previous XOFT2 loaded in "RTE360", scale factor BO. Tag for cell is "RPRE," (i.e. same cell as used subsequently for RPREPR).
- XOFT2PRE: Value of "final cotangent of flight path angle for precision trajectory", scale factor BO, set to COGA in "PREC125".

$$T\underline{S} = K_{tenb4}$$
 QUADROT  $T\underline{S}$  (now in control coordinates)

Return

#### Quantities in Computations

## See also list of major variables and list of routines

- BDT: "Effect of rate of change of required velocity, and gravity, acting during the two-second computing interval, upon velocity-to-begained," scale factor B7, units meters/centi-second. Set 0 in "S40.1".
- BURNANG: Value of one-half the central angle estimated to be traveled during the External Delta-V burn, scale factor BO, units revolutions, stored in push-down location 14D.
- Cdvthresh: Single precision erasable memory constant, program notation "DVTHRESH", scale factor B-2, units meters/centi-second, giving velocity gate used in "S40.8" for concluding that engine failure has taken place. Program shifts constant right 9 places before use, to scale it B7 meters/centi-second (double precision). In order to avoid improper performance, constant should exceed the velocity increment obtained by ullage (in a 2-second interval).
- Ceimplsec: Single precision erasable memory constant, program notation "EIMPlSEC", scale factor Bl4, units kilogram-meters/centi-second. When divided by mass of vehicle, would give the SPS impulse velocity acquired in the first second of burn. For a value in pound-seconds, PSEC, the fraction in the cell may be computed as PSEC x 10-2 x 9.80665 x 0.45359237 x 2-14, where first term is value, second converts to centi-seconds, third is g, fourth converts from pounds to kilograms, and fifth is scale factor. Constant is used double precision, with least significant half the cell used for CefimpOl\*
- CefimpOl: Single precision erasable memory constant, program notation "EFIMPOl", scale factor Bl4, units kilogram-meters/centi-second to gives the slope of the SPS impulse curve from 0 to 1 second. For a value in pound-seconds/second, PNDSSC, the fraction in the cell may be computed as PNDSSC x 10-4 x 9.80665 x 0.45359237 x 2-14, where first term is value, second converts to centi-seconds, third is g, fourth converts from pounds to kilograms, and fifth is scale factor. Constant is used double precision, with least significant half the cell used for Cefimpl6.
- Cefimpl6: Single precision erasable memory constant, program notation "EFIMP16", scale factor Bl4, units kilogram-meters/centi-second to gives the slope of the SPS impulse curve from 1 to 6 seconds (and may be computed by the formula given for CefimpOl above). The constant is used double precision, with least significant half the cell used for Cejj22r2m (see Orbital Integration). Is equivalent to thrust, of course.
- Cemdot: Single precision erasable memory constant, program notation "EMDOT", scale factor B3, units kilograms/centi-second, giving the nominal mass flow rate for the SPS engine.

Cerepfrac: See Digital Autopilot TVC Routines.

Ctdecay: Single precision erasable memory constant, program notation "ETDECAY", scale factor Bl4, units centi-seconds, giving value of thrust decay time (i.e. equivalent full-thrust time). It is subtracted from the "raw" time-to-go, and therefore should be a positive number in the memory. Used in "S40.8" only (for SPS burns).

CAPF: See Burn Control.

CSMMASS: See Digital Autopilot Interface Routines.

CSTEER: Scalar in cross-product steering law, scale factor B2. It is set to ECSTEER in "P4OCSM"(provided a Lambert burn specified), and otherwise has most significant half zero. Least significant half is always zero.

DAPDATR1: See Digital Autopilot Interface Routines.

DELLT4: See Rendezvous Computations.

DELTAM: Value of (CSTEER BDT - DELVREF), scale factor B7, units meters/centi-second. Its unit vector (scale factor B1) is stored temporarily in the push-down list.

DELVEET3: See Rendezvous Computations (DELVSIN occupies the same cells).

DELVREF: See General Program Control.

DELVSAB: Absolute value of DELVSIN used in "S40.1" in the computation of BURNANG for External Delta-V burns, scale factor B7, units meters/centi-second.

DELVSIN: See Burn Control.

DELVSUM: Value of sum of DELVREF outputs from Average-G computed in "UPDATEVG" for Lambert burn, used to correct Vgtig for accelerometer-output velocity gained since "S40.9" established. Scale factor B7, units meters/centi-second. Initialized to 0 in "SETUP.9".

GDT, GDT1: See General Program Control.

GOBL: See General Program Control.

 $^{\rm K}$ 100bml4: Constant, program notation "100B-14", scale factor Bl4, units centi-seconds. Value is 100 x  $2^{-14}$ , corresponding to one second.

 $^{K}$ 200cs: Constant, program notation "200CS", scale factor Bl2, units centi-seconds. Value is 200 x  $^{2-12}$ , corresponding to 2 seconds.

 $K_{500bml4}$ : Constant, program notation "500B-14", scale factor Bl4, units centi-seconds. Value is 500 x  $2^{-14}$ , corresponding to 5 seconds.

- K<sub>2rcsf</sub> constant, program notation "S40.135", scale factor B23, nominal value 69.6005183 x 2<sup>-23</sup>. Value corresponds to 796 K<sub>fres2</sub> times 2<sup>-23</sup>, i.e. the velocity increment (after dividing by MASS) for 7.96 seconds of two-jet RCS thrusting. See Burn Control for K<sub>fres2</sub> value. Octal value is 00000<sub>8</sub> 04263<sub>8</sub>, corresponding to 69.59375 x 2<sup>-23</sup>. Before original ignition, "S40.13" is entered 5 seconds before ignition time, with last Average-G sample made 5.96 seconds before ignition. Program zeros channel 5 (ullage jets) at end of "IGNITION" routine, 2 seconds after ignition.
- $K_{2secnds}$ : Constant, program notation "FOURSEC +1", scale factor Bl3, units centi-seconds. Octal value is  $00620_8$   $00000_8$ , corresponding to  $200 \times 2^{-13}$ , or two seconds.
- K<sub>2vexh</sub>: Constant, program notation "2VEXHUST", scale factor B7, units meters/centi-second. Value is 63.020792 x 2<sup>-7</sup>, corresponding to 2 x 31.510396 x 2<sup>-7</sup>, where first term is an equation factor of two, second is the exhaust velocity in meters/centi-second, and the third is the scale factor. Exhaust velocity of 3151.0396 meters/second (10338.05643 fps) corresponds to an I dividing by 9.80665, of about 321.32 seconds, or 20500/63.8.
- K earthmu: Constant, program notation "EARTHMU", scale factor B36, value  $-3.986032\text{ElO} \times 2^{-36}$ , corresponding to earth  $-\mu$  (in units of meters  $^3/\text{centi-second}^2$ ).
- K eplo: Constant, program notation "EP4(10)L", scale factor BO, units revolutions. Value is 0.027777777, corresponding to ten degrees.
- Kep45: Constant, program notation "EP4(45)L", scale factor BO, units revolutions. Value is 0.125, corresponding to 45 degrees.
- $^{\rm K}$  epslo: Constant, program notation "EP4(10)H", scale factor BO, units revolutions. Value is 0.027777777, the same as  $^{\rm K}$  eplo (duplicate storage in "high" part of memory).
- $^{\rm K}{\rm eps45}{\rm :}$  Constant, program notation "EP4(45)H", scale factor BO, units revolutions. Value is 0.125, the same as  $^{\rm K}{\rm ep45}{\rm :}$
- K foursec: Constant, program notation "FOURSEC", scale factor B28, units centi-seconds. Value is  $400 \times 2^{-28}$ , corresponding to four seconds.
- K frepfrac: See Digital Autopilot TVC Routines.
- K mfourdt: Constant, program notation "-FOURDT", scale factor Bl6, units centi-seconds. Value is  $-800 \times 2^{-18}$ , corresponding to (-1) x 200 x  $2^{-16}$ , where first term is an equation factor, second is computing interval (i.e. 2 seconds), and third is scale factor.

- K : See Attitude Maneuvers (equivalent effect achieved to use of explicit constant, by checking most significant half of magnitude for 0).
- $K_{\rm minmagr}$ : Dummy constant used to show effect of checking for magnitude of vector information, scale factor B30, units meters. Value is equivalent to  $2^{-14}$  (cf.  $K_{\rm minmag}$ ), or  $2^{16}$  meters.
- K : Constant, program notation "PBIAS", scale factor BO, units revolutions. Value is -0.00597222222, corresponding to -2.15 degrees (the "pitch mechanical bias with thrust on"). Hence a PACTOFF input of +2.15 degrees would be considered to line up the bell in pitch along +X.
- K<sub>tenb4</sub>: Constant, program notation "TENBNK14", scale factor B4, value 10 x 2<sup>-4</sup>, corresponding to 10. Used to correct for the fact that matrix elements of QUADROT are multiplied by O.l because of the cycle rate during Attitude Maneuvers.
- Kthetcon: Constant, program notation "THETACON", scale factor B6, value 0.31830989 x  $2^{-8}$ . Value corresponds to  $\frac{1}{2}$  x  $(1/2\pi)$  x  $2^{-6}$ , where first term is an equation factor of one-half (to obtain half the central angle traveled during the burn), second converts from radians to revolutions, and third is scale factor.
- K<sub>trims</sub>: Constant, program notation "TRIMSCAL", scale factor B-13, value  $1.07975111 \times 2^{-1}$ . Value corresponds to 85.41 x 1/(360 x 3600) x  $2^{13}$ , where first term is bit weight in arc seconds for PACTOFF and YACTOFF, second converts to revolutions, and third is scale factor.
- $^{\rm K}$  twodt: Constant, program notation "TWODT", scale factor B28, units centi-seconds. Value is 200 x 2^-28, corresponding to 2 seconds.
- K : Constant, program notation "YBIAS", scale factor BO, units revolutions. Value is +0.00263888889, corresponding to +0.95 degrees (the "yaw mechanical bias with thrust on"). Hence a YACTOFF input of -0.95 degrees would be considered to line up the bell in yaw along +X.

KPRIMEDT: See Digital Autopilot TVC Routines.

MASS: See Digital Autopilot Interface Routines. Incorrect "double precision".

MASSTMP: Temporary storage for CSMMASS in "S40.8", scale factor B16, units kilograms, used to achieve restart protection there.

NBRCYCLP: Single precision counter, scale factor Bl4, of the number of cycles of DELVREF information that have been summed in DELVSUM. It is incremented in "UPDATEVG" and reset in "SETUP.9". It is used for restart protection purposes (with NBRCYCLS, which is in the preceding cell), and also to update V by the suitable amount of BDT for the time elapsed since "S40.9" was established.

NBRCYCLS: Single precision counter, scale factor Bl4, used in conjunction with NBRCYCLP. At the end of "S40.9", it is set to -l as a flag to "UPDATEVG" that a new Lambert solution has been obtained. It is also set to an initial condition of -l in "P40SXTY" (for P40 and P41) before Average-G is started.

NOMTIG: See Burn Control.

NVWORD1: See Burn Control.

OMEGAC: See Digital Autopilot TVC Routines.

PACTOFF: See Digital Autopilot TVC Routines.

PITANG: Value of angle in pitch axis used in "S40.2,3", scale factor BO, units revolutions. Used to calculate the desired position of the engine bell in spacecraft coordinates.

POINTVSM: See Attitude Maneuvers.

QFCT: Value of quantity computed in "S40.1B", scale factor B-5, units meters/centi-second<sup>2</sup>, stored in push-down list location 12D.

QUADROT : See Attitude Maneuvers.

 $\underline{R}_{init}$ : See Rendezvous Computations.

 $\underline{R}_{tig}$ : See Burn Control.

REPFRAC: See Digital Autopilot TVC Routines.

RTX1, RTX2: See Orbital Integration.

SCAXIS: See Attitude Maneuvers.

Tgo: Value of time-to-go computed in "S40.8", scale factor B28, units centi-seconds. Least significant half loaded with required delay before cutoff (for restart protection purposes) in "S40.81", scale factor B14.

T<sub>nit</sub>: Value of time tag associated with state vector loaded by "SETUP.9", scale factor B28, units centi-seconds.

The state of This for previous entry into "S40.9", loaded at the nit previous of "S40.9", scale factor B28, units centi-seconds. Used with This to determine the proper divisor (with K200cs) for difference of required velocities, in computation of BDT. Since accelerometer sampling at 2 second intervals, value used to divide velocity difference would be expected to be an integer (e.g. 2 if four seconds elapsed). Time difference shifted left 17 places after being formed, giving result modulo 21 centi-seconds (20.48 seconds).

T<sub>pass4</sub>: See Burn Control.

 $\overline{\text{UT}}$ : Unit vector, scale factor Bl, in the direction of desired thrust (expressed in reference coordinates). Cell also used for temporary storage purposes.

 $\underline{V}_g$ : Velocity-to-be-gained vector, scale factor B7, units meters/centisecond, in reference coordinates.

 $\underline{\underline{V}}_{\text{gtig}}$ : See Burn Control (during Average-G running, retains the previous value of  $\underline{\underline{V}}_{g}$ ).

<u>V</u>init: See Rendezvous Computations.

 $\underline{V}_{\text{iprime}}$ : See Rendezvous Computations.

 $\frac{V}{\text{rprev}}$ : Value of previous  $\frac{V}{\text{iprime}}$  (i.e. the one associated with  $\frac{V}{\text{nitprev}}$ ), scale factor B7, units meters/centi-second.

 $\underline{V}_{\text{tig}}$ : See Burn Control.

VGDISP: See Burn Control.

 $\underline{X}_{smd}$ ,  $\underline{Y}_{smd}$ . See Inflight Alignment. Program notation also  $[X_{scref}]$ .

YACTOFF: See Digital Autopilot TVC Routines.

YAWANG: Value of angle in yaw axis used in "S40.2,3", scale factor BO, units revolutions. Cf. PITANG.

## Telemetry

<u>DODOWNTM</u> Entered after receipt of program interrupt #8, telemetry end pulse (from telemetry system)

If bit 7(Word Order Code) of channel 13 = 0:

Perform "Cl3STALL"

Set bit 7(Word Order Code) of channel 13 = 1

Proceed to address specified by DNTMGOTO

<u>DNPHASE1</u> Initial condition set in "STARTSUB" for DNTMGOTO

VAC5+32+i = PHASEi (i = 1-6) Restart-group phase values

VAC5+39 = MPAC+3 Used in display interface routines

for return address

VAC5+40<sub>dp</sub> = NEWLOC Contains starting address for job

being established

VAC5+22 = NEWJOB Control of job selection

VAC5+26 = NEWPRIO Priority of new job

Return

NOTE: See 3420.5-27 for details of the significance of the above quantities. They are intended to be an aid to determining "what happened" when other methods (such as flag words or program alarms) give insufficient detail. Use of these quantities would require access to the program listing, and a detailed understanding of the coding implementation. Such details (absolute machine addresses, and all restart points) can be obtained from the listing as necessary; they are not included in this document.

## Quantities in Computations

See also list of major variables and list of routines

- ADR: Single precision dummy cell used for temporary storage of the address information taken from the cell whose address is in CTLIST (i.e. the "control", or master, telemetry list). If it is read as negative, this means that the end of the master list (the final entry) has been reached. When the necessary number of telemetry transmissions have taken place based on this last entry, the list is started again (CTLIST is complemented if ADR is found negative, for control in "DNPHASE2").
- CTLIST: Single precision cell initialized in "DNPHASE1" with the starting address for the "control", or master, telemetry list, and subsequently incremented in "DNPHASE2" as quantities are read from this list. When the final quantity is read, CTLIST is complemented (see ADR) to cause list to be restarted again.
- DNECADR: Single precision erasable memory cell used to contain the address (and other) information associated with the transmission of a series of words based upon a single entry into the control or sublist table. Bits 8-1 give the S-register portion of the word in E-memory (the most significant half), while bits 11-9 give the EBANK. If bits 14-12 are in the range 0-5, they control the transmission of 1-6 respectively consecutive erasable memory pairs. While this transmission is going on, DNECADR will be positive, causing branching at the start of "DNPHASE2" to "FETCH2WD", where bits 14-12 are decremented by 1 and bits 11-1 incremented by 2 (for double precision operation). When final cell has been sent based on a given table entry, DNECADR becomes negative, allowing further checks in "DNPHASE2".

  If bits 14-12 of DNECADR are 6, this means a "sublist" (i.e. a list of telemetry quantities that can be common to several master

lists 14-12 of DNECADR are 6, this means a "sublist" (i.e. a list of telemetry quantities that can be common to several master lists, hence serving as a quasi "sub-routine" list), with bits ll-l giving its starting address. Finally, if these bits are 7, they indicate transmission of channel information.

DNLSTCOD: Single precision cell, scale factor B14, loaded by various mission programs (e.g. in V37 processing, transition to P11 or P62, or start of P27) with the desired serial number (in range 0-4) of the master downlist to be sent. It is used in "DNPHASE1" to index K dntable to select the proper starting address, and for list id.

DNTMBUFF: Set of 12 erasable memory cells which can be loaded in "SNAPLOOP" with values of quantities (such as vehicle state vector) requiring sampling at a single point in the computation cycle. A "snapshot" is indicated by bits 14-12 of DNECADR being 6 (a sublist) and the first word in that list being negative. Looping continues in "SNAPLOOP" until the next negative word is found: this word is not used for address information to be placed into DNTMBUFF, but instead is used to read the memory directly and send the indicated word. Consequently, 7 double precision cells, e.g. position, velocity, and time, can be subject to the "snapshot" process at a given telemetry interrupt.

DNTMGOTO: Single precision cell containing address to which transfer is to be made when a telemetry interrupt (#8) is received. Except for initialization, it would be expected to remain at "DNPHASE2" for normal (i.e. not erasable memory dump) downlists.

DUMPLOC: Single precision cell (assigned same erasable memory cell as TMINDEX) used to control the performance of the erasable memory dump program. Initialized to zero at the start of "DNDUMPI", and subsequently incremented by 2 in "DNDUMP" to permit selection of the next set of erasable memory cells. Bits 8-1 (000g - 377g) select the cell within the erasable memory bank, since each bank has 256 cells. Bits 11-9 (carries propagate from bit 8, of course) select the erasable memory bank (0 - 7). Bits 13-12 serve as a counter of the number of complete erasable dumps which have been performed (when bit 13 becomes 1, indicating 2 dumps, dumps cease).

EBANK: See Data Input/Output.

Kdntable: Table of single precision starting addresses for master i telemetry downlists, used in "DNPHASE1" to load the proper initial conditions for CTLIST based upon the present value of DNLSTCOD. Program notation for first table entry is "DNTABLE". Values are:

<u>i</u>	Starting Address	Identification of List Data
0 1 2 3 4	"CMCSTADL" "CMENTRDL" "CMRENDDL" "CMPOWEDL" "CMPG22DL"	Coast and Align Entry and Update Rendezvous & Prethrust Powered Program 22

SUBADR: Single precision dummy cell used for temporary storage of the address information taken from the cell whose address is in SUBLIST (i.e. a "sublist", see DNECADR). If it is read as negative, this means that the end of the sublist has been reached. When the necessary number of telemetry transmissions based on this last entry have taken place, the master list is used again (SUBLIST is set negative in "NEXTINSL", for control in "DNPHASE2"). Function is analogous to ADR's for a master list.

SUBLIST: Single precision cell initialized in "SETWO+2" to DNECADR for a non-snapshot list (for bits 14-12 of DNECADR = 6), giving then the starting address of the required sublist. While positive, "DNPHASE2" will transfer to "NEXTINSL" whenever DNECADR becomes negative: "NEXTINSL" increments SUBLIST until a negative readout (see SUBADR) is encountered, when SUBLIST is set to -1 to cause "DNPHASE2" to return to the master list. Function is analogous to CTLIST's for a master list. In "SNAPLOOP", it is used to index the readout of the snapshot sublist, and is left at -1 when "SNAPLOOP" is done to cause "DNPHASE2" to take next entry from master list (which should be a requirement to transmit DNTMBUFF cells).

TMINDEX: Single precision cell, scale factor Bl4, initialized to O in "SETWO+2" for use in indexing DNTMBUFF storage in "SNAPLOOP". It is assigned the same cell as DNECADR.

VAC5: First address in VAC area #5 (see 3420.5-27), the last to be assigned, and hence used in "VAC5STOR" to retain trouble-shooting information.

Information on the downlists appears on the following pages:

Telemetry Table Interpretation	TELE-9
Coast and Align List	TELE-11
Entry and Update List	TELE-16
Rendezvous & Prethrust List	TELE-21
Powered List	TELE-26
Program 22 List	TELE-31
Special Erasable Memory Dump List	TELE-36

#### Telemetry Table Interpretation

To satisfy mission requirements, five different sets of downlinked memory cells can be specified. The mission program achieves the required specification by setting a quantity between 0 and 4 into DNLSTCOD (usually as part of the processing of a V37 program change). This quantity is used to index a table of fixed memory addresses in order to find the starting address of the particular list of downlinked memory cells required (powered flight, coast and align, etc.). In order to minimize the amount of fixed memory required for storage of this information, and maximize the flexibility of the information that is telemetered, a special storage format for the required addresses is used.

The table whose starting address is found by using DNLSTCOD is known as the "control" (or master) downlist. There is a separate such list for each different downlink set of information, and except for the first word in each 100-word set, the transmission of the information in the downlink set is under the control of information in this control list.

Within this control list, several different types of options can be employed:

- a) A single (double precision, i.e. 2 consecutive erasable memory cells) downlink transmission can be specified. This is done by storing the ECADR (see 3420.5-27) of the first word in bits ll-l of the fixed memory cell. The assembler operation is "lDNADR".
- b) Two downlink transmissions (giving four cells in a row) can be specified. This is done by storing the ECADR for the first word in bits 11-1 of the fixed memory cell and putting a 1 in bit 12. The assembler operation in this case is "2DNADR".
- c) Three downlink transmissions (giving six cells in a row) can be specified. Here again, the ECADR of the first word is in bits ll-l of the fixed memory cell and a l is put in bit 13. The assembler operation in this case is "3DNADR".
- d) Four, five, or six (giving 8, 10, or 12 cells in a row) can also be specified. The ECADR of the first word is in bits 11-1 of the fixed memory cell and bits 14-12 contain the (number 1) of the transmissions desired: bit 14 is a 1 and bit 12 is a 1 for six transmissions, for example. The assembler operations are nDNADR.
- e) A "sublist" can be specified. This permits a sequence of cells, such as state vector information, that may be common to more than one list to be specified only once (a sort of quasi "sub-routine" capability). In this case, bits ll-l contain the address of the sublist (S-register portion, since in same bank) and bits l4-l2 contain 6 (assembler operation is "DNPTR"). This particular assignment makes the 15-bit memory word of the form 3XXXX: rather than subtracting or masking out the "3" (as

indicated in this writeup), the coding takes advantage of the fact that this is the proper form for a "clear add" instruction (hence merely indexes on 00000<sub>g</sub>).

- f) A single downlink transmission of a pair of channels can be specified. In this case, bits 6-1 would contain the channel number and bits 14-12 would contain 7. The assembler operation for this is "DNCHAN", and advantage is taken of the "7" by indexing to form the required order, rather than subtracting or masking it out as indicated in this writeup.
- g) The end of the control list (indicating that the list should be started again) is flagged by having the cell be negative (e.g. "-6DNADR" instead of "6DNADR").

If, per item e, a "sublist" in specified, then two options are available:

- 1. A "normal" sublist, in which case information can be stored in a manner exactly like the control list, except that option "e" should <u>not</u> be used (sublists cannot reference other sublists). The end of the sublist is flagged by a negative cell (as in option "g"), indicating in this case that information should again be taken from the control (master) list (at the line after the DNPTR).
- 2) A "snapshot" sublist, flagged by the fact that the first item in the sublist is negative (i.e. "-lDNADR"). The "snapshot" feature allows up to seven double precision words to be sampled at the same telemetry interrupt point, to achieve on the downlink a consistency of this information (e.g. position, velocity, and time of state vector). In this case, the remaining items in the sublist must be "lDNADR" form; the cell data specified by the first table entry through the next-to-last are stored in a special telemetry buffer (DNTMBUFF). The last entry in the sublist is negative, and in this case only is the first cell address transmitted. In all other cases, addresses in the lists are stored in the order in which they are transmitted. In order to cause transmission of the DNTMBUFF cells, the entry in the control list following the DNPTR cell for the snapshot should require transmission of DNTMBUFF cells (e.g. "6DNADR DNTMBUFF").

Except for specification of snapshot lists, which can occur only by DNPTR orders in the master (control) list, there is no maximum to the number of individual entries in either the control or sublists, except of course the convention that a complete telemetry cycle involves 100 double precision words. In addition, downlink processing format requires that word #51 (the computer clock) have a word order code bit of 0: a check for transmission of this word is made only for readouts from the master list (address 0024<sub>g</sub>).

#### Information in Telemetered Words

There are five different downlists that may be transmitted during the flight (plus the special erasable memory dump initiated by a V74E). These five lists are implemented in the computer memory as the addresses of cells in erasable memory: the contents of the cells, in turn, can depend upon the phasing of the telemetry interrupts with respect to the other computations. In addition, cells are frequently time shared among different mission phases. The information below should be augmented by more detailed material on the telemetry data for items not covered.

Unless otherwise specified, the contents of the words below reflect both Channel 34 and Channel 35 (i.e. a double precision number). In those cases for which the information in the two channels is not closely related, "a" signifies the Channel 34 information and "b" the Channel 35 information.

#### Coast and Align List

This list, with starting address of "CMCSTADL", is selected for DNLSTCOD = 0. It is used in POO, POl, PO2, PO3, PO6, PO7, P51, P52, P53, and P54.

95-100	Spare	For all 6 words, the "a" part is 0 and the "b" part is accumulator when interrupt.		

# Special Erasable Memory Dump List

Input of a V74E causes DNTMGOTO to be switched so as to start at the next telemetry interrupt the transmission of a "dump" of the erasable memory (all cells are sent sequentially for two times, i.e. two complete passes through the erasable memory). The erasable memory hardware is divided into eight "banks" of 256 cells each, and a similar division is made for downlinking of information: the first two words are used for control data, and the next 128 contain the 256 words in the particular bank set identified by the first two words. The format of the information is:

Word #	<u>Quantity</u>	Meaning				
List Iden	ntification					
la	017778	Identification of list.				
lb	773408	Special synchronization bits.				
2a	DUMPLOC	See Telemetry (page TELE-7).				
2b	TIMEL	Least significant half of computer clock.				
Erasable Memory Bank						
3-130	Cells in bank (	addresses sent in consecutive increasing order).				

#### Testing Routines

SELFCHK Address set as initial condition for SELFRET in "STARTSB2"

Perform "SMODECHK" (will not return unless self-check is desired)

Proceed to "ERASCHK"

#### SMODECHK

SKEEP1 = Return address

Perform "CHECKNJ" (returns immediately if no new job waiting, and otherwise returns after doing job(s))

If SMODE = +0:

Proceed to second line of "SMODECHK"

If |SMODE| ≤8:

SCOUNT = SCOUNT + 1

If SMODE = -0, proceed to address specified by SKEEP1

If |SMODE| = 1, 2, 3, 6, 7, or 8: (10<sub>8</sub> = decimal 8)

Proceed to address specified by SKEEPl

If |SMODE| = 4, proceed to "ERASCHK"

If |SMODE| = 5, proceed to "ROPECHK"

SMODE = 0 (magnitude exceeded 8)

Proceed to "SELFCHK"

# **PRERRORS**

If ERESTORE = 0, proceed to "ERRORS"

 $E_{SKEEP7} = SKEEP5_{dp}$ 

ERESTORE = 0

Proceed to "ERRORS"

#### ERRORS

Inhibit interrupts (released upon return from alarm routine)

SFAIL = Return address (to routine calling "PRERRORS" or "ERRORS")

ALMCADR = SFAIL

ERCOUNT = ERCOUNT + 1

Perform "ALARM2" (pattern 1102g)

If SMODE = -0:

Proceed to address specified by SFAIL

If SMODE > 0:

SMODE = +0

Proceed to "SELFCHK"

#### ERASCHK

SKEEP2 = 1 (flag to check cells  $006l_8 - 1373_8$ )

EBANK = O

SKEEP7 = 1461<sub>8</sub> (first cell in bank 0 to be checked, since cells 0 - 60<sub>8</sub> are "special" erasable cells)

SKEEP3 =  $1777_8$  (last cell)

Proceed to "ERASLOOP"

#### ERASLOOP

Inhibit interrupts

SKEEP4 = EBANK (non-zero EBANK loads bits 11-9)

 $SKEEP5_{dp} = E_{SKEEP7_{dp}}$  (address also determined by EBANK)

ERESTORE = SKEEP7

 $E_{SKEEP7} = SKEEP7$  (loads with own S-register address)

 $E_{SKEEP7+1} = SKEEP7 + 1$ 

If  $E_{SKEEP7}$  -  $E_{SKEEP7+1} \neq$  -1, perform "PRERRORS"

If ERESTORE  $\neq$  0:

 $E_{SKEEP7_{dp}} = - E_{SKEEP7_{dp}}$ 

If  $E_{SKEEP7+1} - E_{SKEEP7} \neq -1$ , perform "PRERRORS"

If ERESTORE ≠ 0:

 $E_{SKEEP7_{dp}} = SKEEP5_{dp}$ 

ERESTORE = 0

```
Release interrupts
Perform "CHECKNJ"
EBANK = bits 11-9 of SKEEP4
SKEEP7 = SKEEP7 + 1
If SKEEP3 - SKEEP7 \neq 0:

#### Quantities in Computations

See also list of major variables and list of routines

- ldPIPADT: See IMU Computations.
- 1SECXT1: See Prelaunch Alignment (set to 1 second for gyro drift determination).
- ACCWD, ACCWD: Value of "horizontal acceleration of launch vehicle" (due to sway) in north-south and east-west directions respectively, scale factor B9, units cm/sec<sup>2</sup>.
- ALFDK: Table of erasable memory quantities used in "ALFLTd" to update values of parameters to be used for filtering in gyro drift computations. The table consists of five double precision constants, one single precision constant (the setting for ALTIM), and a reset value of ALTIMS (which could be e.g. -1 for all tables). Values must be initialized by an erasable memory load(with the first value at "ALFDK", octal cell 2022a), with settings for ALTIM, ALTIMS, BUFTCPIP, BUFTCERC, BUFSLPAZ, BUFSLPVRD, and BUFSLPNSD stored in that order (first two single precision, remainder double precision). Scale factor of first two assumed Bl4, and the remainder assumed BO, in this writeup. See below for "typical" values (obtained from Sundisk program, when information was in fixed memory).
- ALMCADR: See General Program Control.
- ALTIM: Single precision value of time remaining prior to change in filter constants for drift measurements, scale factor  $Bl_4$ , units seconds. To cause a set of gains to be used for T seconds, ALTIM is set to -(T-2).
- ALTIMS: Single precision flag cell set to 0 when a gain change should be made (see ALTIM), and then reset (e.g. to -1) when the gain change has been done, scale factor Bl4.
- ALXIS: Single precision cell, scale factor B14, used to control selection of values from ALFDK, erasable memory table (set to 144 in "ESTIMS,").
- ANGX, ANGY, ANGZ: Values of determined angle changes about vertical, south, and east axes respectively, scale factor BO, units revolutions: they are "azimuth alignment angle", "south axis leveling angle", and "east axis leveling angle" respectively (alpha, beta, gamma in official equation documentation).
- BUFSLPAZ, BUFSLPNSD, BUFSLPVRD: Set of buffer cells used to contain the values of the slopes of the gains for azimuth angle, north south drift, and vertical drift respectively, scale factor BO, read from ALFDK table set. Cells are ALDK+4, ALDK+8, and ALDK+6 respectively.
- BUFTCERC, BUFTCPIP: Set of buffer cells used to contain the values of the "time constants" for the erection angles ("east axis leveling angle" and PIPA outputs, scale factor BO, as read from ALFDK table set. Cells are ALDK+2 and ALDK.

Catd: See Prelaunch Alignment.

Cazmth: See Prelaunch Alignment.

- CMPX1: Single precision cell, scale factor B14, used to set proper contents of index register X1 to permit use of an index loop (X1 is set successively to ± 1) to perform calculations in "ALFLT<sub>d</sub>": use of the cell is not shown in this writeup.
- CSANGi (i = X,Y,Z): Values of cosine of ANGX, ANGY, and ANGZ, scale factor Bl, stored in push-down list locations 16D, 18D, and 20D respectively.
- DELM, DELM: Value of measurement quantity in south and easterly directions used in drift test, scale factor B-2, units radians.
- DPIPAY, DPIPAZ: See Prelaunch Alignment.
- DRIFTI: Value of gyro drift measurement output displayed in "TORQUE", scale factor (assumed) BO, units "radians", giving the "south gyro drift".
- DRIFTO: Value of gyro drift measurement output displayed in "VALMIS", scale factor (assumed) BO, units "radians", giving the "vertical gyro drift".
- DRIFTT: Input "drift" to gyro drift determination routine (to separate "east gyro drift" from "azimuth error"), scale factor BO, units radians. It has only its most significant half loaded by calling routines, with the least significant half set O.

EBANK: See Data Input/Output.

ERCOMP: See Prelaunch Alignment.

ERCOUNT: Single precision cell, scale factor B14, used to count the number of errors encountered in the self-check routine. The cell is initialized to 0 as part of a verb 36 fresh start, and may be read as the third component of noun 08.

ERESTORE: Single precision cell, initialized to 0 as part of a fresh start, used for control purposes in functions associated with the erasable memory checking ("ERASLOOP") portion of the self-check program. It is set to the S-register portion of the lower of the two erasable memory cells being checked (the same as SKEEP7) before these cells are altered. If a restart is encountered, the "GOPROG" routine checks that bits 15-11 of the word are zero (i.e. it is less than 20008, as required for erasable memory cells), and that it is equal to SKEEP7 (assuming, of course, the word in non-zero). Both conditions must be satisfied before SKEEP4 (for EBANK) and SKEEP7 address information are used to restore the cells; if one is not, then a fresh start is performed. Since

the ERESTORE cell (address 1360g) is subject to erasable memory cell checks, when it does not necessarily contain the same data as SKEEP7, a fresh start may be forced even though SKEEP4 and SKEEP7 (neither of these cells are used for change purposes in the erasable memory check routine, since upper limit is 1373g) is sufficient to permit restoration of erasable memory contents.

ERVECTOR: See Prelaunch Alignment.

FBANK: Hardware register cell (address  $0004_8$ ) used to contain the fixed memory bank number (if in range  $30_8-37_8$ , FEXT is also used). See 3420.5-27 for details (only bits 15-11 are used).

FEXT: Computer hardware channel (channel 07, also referred to as SUPERBNK) used to select the appropriate fixed-memory bank for FBANK settings of 30g or more. Only bits 7-5 are used, with a setting of 3 selecting banks 3i; a setting of 4 selecting banks 4i (bank 43 is the last one in the computer). See 3420.5-27 for details.

GCOMP: See IMU Computations.

GCOMPSW: See IMU Computations.

GEOCOMP1: See Prelaunch Alignment. Set to +0 to indicate gyro drift measurement, but this logic <u>not</u> shown in this writeup. Instead, the zero-value case is in this writeup and the non-zero case in Prelaunch Alignment.

GTSWTLT1: See Prelaunch Alignment.

INTY, INTZ: Value of filtered accelerometer output (corrected for vehicle sway etc.) used in gyro drift test, scale factor B-2, units radians. Could also be considered to be "south" and "east" velocity increments expressed in units of g's (see K pipasc).

KaskO: Constant, program notation "ALSK", scale factor Bl2, value 0.17329931. Value corresponds to 0.72402338 x 980.402 x  $2^{-12}$ , where first term is "wind-induced sway velocity gain" (official equation documentation notation "Ky"), second converts DELM to units of cm/sec (i.e. units of VLAUN, cf. Kpipasc), and third term is scale factor.

 $^{\rm K}$  ask2: Constant, program notation "ALSK +2", scale factor B12, value -0.00835370. Value corresponds to 0.03490074 x (-1) x 980.402 x 2^{-12}, where first term is "wind-induced sway accelerometer gain" (official equation documentation notation " $^{\rm K}_8$ "), second is an equation factor, third converts to units of cm/sec² (cf.  $^{\rm K}_{\rm pipasc}$ ), and fourth term is scale factor.

- K :: Constant, program notation "GEORGEJ", scale factor B-2, value georgj 0.63661977. Value corresponds to  $(1/2\pi) \times 2^2$ , to convert between radians and revolutions (the interpretive language trig functions require angle measurements in revolutions).
- K georgk: Constant formerly incorporated in fixed memory for use in IMU calibration computations. Value was 0.59737013, scale factor B-13. This corresponded to about 7.2921158E-5 x 2<sup>13</sup>, where first term is earth rate in rad/sec (period of about 86164.0912 seconds).
- $K_{\text{omegms}}$ : See Prelaunch Alignment.
- K : Constant, program notation "PIPASC", scale factor B-7, value pipasc 0.76376833. Value corresponds to 5.85 x (1/980.402) x 27, where first term is nominal accelerometer scale factor (cm/sec per count), second is normalization factor (acceleration due to gravity), and third is scale factor. For convenience in description, a fourth factor of "1/second" has been assumed reflected in this constant, giving for units of result (in INTY etc.) "radians".
- K soupyO: Constant, program notation "SOUPLY", scale factor BO, used in "ESTIMS $_{\rm d}$ " to initialize KGAINPIP. Value is 0.93505870.
- K soupy2: Constant, program notation "SOUPLY +2", scale factor B2, used in "ESTIMS," to initialize KGAINERC. Value is 0.26266423, corresponding to a "true value" of about 1.05065692.
- K stbnk: Single precision constant, program notation "LSTBNKCH", octal value 66100g, corresponding to an FBANK value (bits 15-11) of 33g and an FEXT value (bits 7-5) of 4, i.e. a final "bank" readout of bank 43g, the final computer hardware fixed memory bank.
- K vesc: Constant, program notation "VELSC", scale factor B-9, value -0.52223476. Value corresponds to (-1) x (1/980.402) x 2', where first term is an equation factor, second converts for acceleration due to gravity (cf. K pipasc), and third is scale factor.
- KGAINAZ, KGAINERC, KGAINNSD, KGAINPIP, KGAINVRD: Values of gains updated each cycle in gyro drift determination computations. KGAINERC and KGAINPIP are initialized to non-zero values in "ESTIMS," and multiplied by "time constants" for "erection angles" and "PIPA outputs" respectively, with scale factors due to initialization of B2 (KGAINERC) and BO. The others (KGAINAZ, KGAINNSD, and KGAINVRD) are initialized to O values in "ESTIMS,", and are incremented each cycle to achieve varying gains for "azimuth angle", "north-south drift", and "vertical drift" respectively: all are considered to have scale factor BO (see ALFDK). Program notation for the quantities is AIK+4, AIK+2, AIK+8, AIK+0, and AIK+6 respectively.
- LENGTHOT: Single precision cell, scale factor Bl4, used to contain time duration information. Initialization must be done as part of erasable memory pre-load (in Prelaunch Alignment is initialized by coding).
- LOSVC2: Single precision cell, program notation "LOSVEC +1", scale factor B-1, units revolutions, loaded with CDU in "ONCEMORE".

NDXCTR: Single precision cell, scale factor Bl4, initialized to 0 in "GEOIMUTT" and incremented to 1 for a "gimbal lock" return from "CALCGA" (angle of 60° or more).

NEWJOB: See General Program Control.

OGC: See Coordinate Transformations (used also as communication cell).

PERFDLAY: See Prelaunch Alignment (for gyro drift test, must be set manually to some value).

PIPA: See IMU Computations.

POSITON: Single precision cell, scale factor BL4, used for indexing and display purposes (used in previous programs to select desired stable member orientation from fixed memory information). Must be loaded manually (inputs in "SHOW" do not change it).

POSNV<sub>y</sub>, POSNV<sub>z</sub>: Values of "horizontal displacement of launch vehicle" in south and east directions respectively, assumed scale factor B9, units cm ("assumed" since scaling of [TRANSMI] elements not known, but treated as B1).

SCOUNT, SCOUNT+1: Pair of single precision counters, scale factor B14, used to count the number of executions of portions of the self-check program. SCOUNT is incremented each time "SMODECHK" is entered with SMODE \( \neq \) +O and with magnitude below 9; SCOUNT+1 is incremented each time "ERASLOOP" is completed (at the end of the test). Both quantities are modulo 2<sup>14</sup>, and would have to be initialized manually since they are not preset as part of a fresh start (V36E), if a "true count" were desired. A value of SCOUNT = 3 (if set 0 before SMODE made e.g. 1) means that the self-test erasable and fixed memory checks have been completed. Addresses are 1366, and 1367, respectively.

SELFRET: See General Program Control.

SFAIL: Single precision cell used in "ERRORS" routine to retain return address information (and hence data on the cause of the self-check difficulty). Contains the same information as ALMCADR if no subsequent alarms (from sources other than self-check) are generated; it is <u>not</u> preset 0 by program unless error reset input.

SKEEP1: Self-check register #1, used to retain return address information from "SMODECHK" and the value of the bank sum while being formed. If the "SHOWSUM" option (V91E) is used, it contains the value of the sum as displayed in R1 (can be either + or -, and if + should be equal to the bank number; if minus should be the complement of the bank number). If self-check memory verification is done, is replaced by the magnitude of the sum before checking against the bank number.

- SKEEP2: Self-check register #2, used in erasable memory check routine as a flag (if non-zero) to cause unswitched erasable to be checked (cells 0061, -1372, plus 1373, partially) after completion of checks for each erasable bank (these cells are in banks 0-2, which should be read for any value of EBANK). Cell is used in fixed memory check routine to contain the contents of the fixed memory cell just read; in the "SHOWSUM" option, it contains the fixed memory bank number (00 43,) displayed in R2, which should be the same as the magnitude of SKEEP1 (value of SKEEP1 is displayed in R1).
- SKEEP3: Self-check register #3, used in erasable memory check routine to contain the value of the last address to be checked (i.e. one more than the final value of SKEEP7 actually used). The routine checks cells in pairs in ascending order (starting with the cell initialized in SKEEP7), and SKEEP3 specifies the final cell forming the upper half of a pair (SKEEP7 +1). Cell is used in fixed memory check to contain for fixed-fixed memory the S-register information (4000g 7777g), and for fixed-switchable memory the S-register information decreased by 2000g. For the "SHOWSUM" option, cell is loaded with the final value of SKEEP2, which gives the final word read from memory (the "bugger word", designed to make the sum of all words in the memory, including itself, equal in magnitude to the bank number) for the bank, and is displayed in R3.
- SKEEP4: Self-check register #4, used in erasable memory check routine to contain the erasable memory bank of the cells being checked (employed in "GOPROG" to reset EBANK, cf. ERESTORE). In fixed memory check routine, bits 15-11 are used to contain the appropriate setting for FBANK and bits 7-5 the appropriate value for FEXT.
- SKEEP5: Self-check register #5, used with SKEEP6 in erasable memory check routine to retain the previous value of the cell being checked (to permit restoration of the cell in "GOPROG" or at the end of the test segment checking the cell). Used in fixed memory check routine to monitor for the presence of two TC self ("transfer control to the present step") orders, indicating that the following cell should be the final one entering the sum (bank sum also halted after last cell in bank has been read). If step not a TC self, SKEEP5 set to +1; if it is, cell is decreased by 1, and after reaching -1 the routine is halted for that bank after the next ("bugger", see SKEEP3) word is incorporated into the sum. Since the operation code for the TC order is O, a "TC self" instruction (which, of course, would cause a hardware restart if encountered in the course of a program execution) appears as OAAAA, where AAAA is the S-register address of the cell in question, in range 2000g - 7777g.

SKEEP6: Self-check register #6, used with SKEEP5 in erasable memory check routine to retain the previous value of the upper half of the pair of cells being checked (cf. SKEEP5). In the fixed memory check routine, is set to -0 to indicate that the "ROPECHK" option is used (automatic check for proper memory sum, part of self-check sequence, with no display unless difficulty); and is set to +1 to indicate that the "SHOWSUM" option is used (enabled by verb 91 from "GOSHOSUM", giving a DSKY display of each bank's sum, number, and "bugger word", with no automatic check for proper memory sum).

SKEEP7: Self check register #7, used in erasable memory check routine to contain the S-register portion of the erasable memory address of the lower half of the pair of cells being checked (see discussion with ERESTORE above). In fixed memory check, is used as an identification of when the two fixed-fixed banks (bank 2 and bank 3, S-register addresses starting at 4000g and 6000g respectively) are to be read.

SMODE: Single precision cell, scale factor Bl4, used to control the performance of the computer self-check routines, and examined whenever no active jobs are to be done (and, of course, no tasks). It is set to +O as part of a fresh start, and can be loaded using N27. A +O value causes the self-check routine to be bypassed; values of magnitude 9 or more cause SMODE to be reset to 0; a value of 4 causes the erasable memory check to be done; a value of 5 causes the fixed memory check to be done; and other values (-O, 1,2,3,6,7, or 8) cause the complete self-check to be done. If SMODE is positive, an error will cause it to be reset O, while if it is negative the self-check will be started again (except for a value of -O, which causes the self-check computations to be started at the point after the failure, as determined by SFAIL).

SNANGi (i = X,Y,Z): Value of sine of ANGX, ANGY, and ANGZ, scale factor B-2, stored in push-down list locations 10D, 12D, and 14D respectively.

SOUTHDR: Indexed cell used in "TORQUE" to retain the value of DRIFTI sp for subsequent use by erasable memory program.

T<sub>mark</sub>: See Prelaunch Alignment.

[TRANSM1]: Transformation matrix used as a "sway transition matrix", contained in erasable memory (must be initialized to values as part of an erasable memory load before running test). Assumed scaling in this writeup for all elements is Bl (after being used to perform multiplication, a left shift of 1 is done). Values from a previous program (Sundisk, which used fixed memory cells) were:

 0.47408845
 0.23125894
 0.14561689

 -0.06360691
 -0.16806746
 0.15582939

 -0.06806784
 -0.75079894
 -0.24878704

These values are the "stored" ones, and must be multiplied by two to find the "true" values:

 0.94817690
 0.46251788
 0.29123378

 -0.12721382
 -0.33613492
 0.31165878

 -0.13613568
 -1.50159788
 -0.49757408

 $\begin{array}{c} \text{VLAUN}_y, \text{ VLAUN}_z: \text{ Value of "horizontal velocity of launch vehicle" (due to sway) in north-south and east-west directions respectively, scale factor B9, units cm/sec. \\ \end{array}$ 

WANGI: Value of (- cos Catd), scale factor BO.

WANGO: Value of (sin Catd), scale factor BO.

WANGT: Quantity set to O if no torquing is performed and to l (scale factor BO) if torquing is to be performed via "EARTHR\*" at the start of "SLEEPIE ". Program notation also "TORQNDX, TORQNDX+1". If it is non-zero, WANGI term is included in computation of WPLATI.

WPLATI, WPLATO, WPLATT: Quantities computed in "ALFLT", scale factor BO, normalized by earth rotation rate (hence are converted to angles, for the one-second gyro drift evaluation cycle, by multiplication by K multiplication by K seorgk). The "I" is south, the "O" is vertical ("azimuth"), and the "T" is east.

# Values of ALFDK information from an earlier program (Sundisk)

108	2101-27		.99957801	.99916095	.00000007	.00000096	0
120	2701-34		.99966814	.99933952	.00000002	.00000028	0
132	3401 <b>-</b> 40		.99972716	.99945654	.00000001	.00000010	, О

The "index" column gives the value of the ALFDK index required to obtain the ALTIM setting (see "ALFLT<sub>d</sub>"). The columns are headed with the cells into which the ALFDK. information is loaded (ALTIMS, a single precision cell, could be loaded with the same value, e.g. -1, for all entries to the table).

#### Quantities in Computations

See also list of major variables and list of routines

COMPNUMB: Single precision cell, scale factor Bl4, containing the total number of uplink data quantities to be sent. It is set to 2 for verbs 70 and 73; for verb 71 it is set to the first data quantity (and hence must be equal to the number of data words +1 (for address of first word) +1 (for its own setting)); for verb 72, it is likewise set to the first data quantity (since each data word is preceded by its address, it therefore must be 2 x data words +1). For verbs 71 and 72, values of COMPNUMB below 3 (the minimum for one data word) or above 20 are rejected: this gives for verb 71 a maximum of 18 single precision data words (or 9 double precision ones, sufficient e.g. for a 3 x 3 matrix), and for verb 72 a maximum of nine single precision data words.

DNLSTCOD: See Telemetry.

EBANK: See Data Input/Output.

MPAC+O: Cell loaded in display routine with the verb that is received (also used for other functions).

MPAC+2: Cell used for communication purposes with display routine, to provide the address into which a quantity (for e.g. noun Ol or O2) is to be loaded (also used for other functions).

QPRET: See Orbital Integration.

 $\underline{R}_{other}$ ,  $\underline{R}_{rect}$ : See Orbital Integration.

RCV: See Orbital Integration.

 $T_c$ : See Orbital Integration.

Teph: See Boost Computations.

Tet, Tetcm, Tetlm: See Orbital Integration.

TDELTAY, TNUY: See Orbital Integration.

UPBUFF: Set of 20 cells (UPBUFF+O through UPBUFF+19) used to contain the uplinked information as it is received. Also used for temporary storage of time information, after completion of the update sequence, for verbs 70 and 73. Cells are loaded during the entry phase of flight with guidance parameters for telemetry purposes. The address of UPBUFF+O is 003048. The last 18 cells of the UPBUFF set also are used for storage of [X smd]: consequently, if it is desired to uplink this preferred IMU alignment for use in P52/P54, this must be the last uplink that is sent before P52/P54 uses the data.

- UPCOUNT: Single precision quantity, scale factor Bl4, containing the serial number of the UPBUFF cell to be loaded next. If cell UPBUFF+n is to be loaded, UPCOUNT = (n +1). When UPCOUNT = COMPNUMB, it is concluded that the basic load has been completed, and the option for "line-by-line" corrections is enabled, during which UPCOUNT does not change.
- UPOLDMOD: Single precision cell, scale factor B14, used to contain the value of MODREG when an update verb is received, and used to restore its proper value (-0, 0, 2, or 20) after the end of the update sequence.
- UPSVFLAG: Single precision cell, scale factor B14, assigned a cell in erasable memory just before the first component of R rect, and set by the update loading process to cause proper processing of a state vector update. The cell is checked in "INTWAKEU", and if non-zero it is concluded that a state vector update was done (if positive, a CSM state vector; if negative, a LM state vector), and after processing the cell is reset 0 (which is also the initial condition set in "DOFSTART"). A value of magnitude 2 (i.e. +2 for CSM and -2 for IM) indicates that the state vector is in moon-centered coordinates (with moon-centered scaling); other non-zero values, such as +1 and -1, are interpreted to mean earth-centered coordinates (with earth-centered scaling).
- UPTEMP: Single precision cell used for temporary storage purposes. In the "line-by-line" correction mode, it contains the loaded value of the component serial number (defined as for UPCOUNT) into which the correction is to be loaded, scale factor Bl4. The address of UPTEMP is 00330<sub>8</sub>.
- UPVERB: Single precision quantity, scale factor BL4, containing information on the update verb being performed: for verbs 70-73, it is set to 0-3 respectively.
- UPVERBSV: Single precision cell, scale factor Bl4, used to retain information on the update verb received while a determination is made if it is allowed: if it is, then UPVERBSV is loaded into UPVERB.

Vother, Vrect: See Orbital Integration.

 $VC\underline{V}$ : See Orbital Integration.

XKEP: See Orbital Integration.

#### Uses of Update Verbs

## Verb 70

Verb 70 could be considered a "liftoff time update". Its transmission format is:

where the "X" information is an octal double precision increment to be added to T and subtracted from the computer clock and the state vector times for CSM and LM, scale factor B28, units centi-seconds. If liftoff were sensed 5 seconds late, for example, then the transmission should be:

$$V 70 E 77777 E 77013 E (V 33 E) (-77013_8 = 764_8 = 500 cs)$$

in order to correct the AGC time information to reflect the proper "liftoff time" (note that V70 keeps the sum of  $T_{\rm eph}$  and the computer clock constant by changing them in opposite directions). If only the computer clock  $(T_{\rm now})$  is to be updated, then verb 73 could be used.

#### Verb 71

Verb 71 is used to perform a "contiguous block update". Its transmission format is:

where the "ii" information is the setting for COMPNUMB, and is two more than the number of data words (i.e. number of XXXXX E's +2). The AAAA information is the erasable memory address into which the first XXXXX data word is to be loaded (successive words are loaded into successive cells), and must be sufficiently compatible with the value of ii so as to avoid requiring erasable memory bank switching. AAAA is in ECADR format, meaning that bits 11-9 give the E-bank number and bits 8-1 the address within the bank (which, for hardware reasons, is added to 1400, within the program). Since there is no lockout (aside from bank switching constraints) on the value of AAAA, caution must be observed to avoid destroying computer control cells (the "ENDSAFE" lockout present in e.g. Sundisk has been deleted).

#### Verb 72

Verb 72 is used to perform a "scatter update". Its transmission format is:

$$V$$
 72  $E$  ii  $E$   $A_1$   $A_1$   $A_1$   $A_1$   $E$  XXXXX  $E$   $A_2$   $A_2$   $A_3$   $A_4$   $A_5$   $A_6$   $A_7$   $A_8$   $A_$ 

where the "ii" information is again the setting for COMPNUMB, and is equal to two times the number of data words plus 1 (and hence must be odd, as well as at least 3 and below 21, i.e. maximum 19 here). The A's are specified for each 15-bit word individually, with no constraints imposed by the software on addresses which may be changed.

## Verb 73

Verb 73 is used to perform an "octal clock increment" (verb 55 can be used to perform the same function for decimal input of hours, minutes, and centi-seconds), and has the following transmission format:

V 73 E XXXXX E XXXXX E (then V 33 E)

where the "X" information is an octal double precision increment to be added to the computer clock (note that the V7O uplink time is subtracted from the computer clock), scale factor B28, units centi-seconds.

#### Sample Update Sequences

1. To load the components of [REFSMMAT] (double precision elements, scale factor B1), the following sequence could be used:

V 71 E 24 E 1733 E (COMPNUMB = 20; "REFSMMAT" = 3,1733)

XXXXX E XXXXX E (row 1 column 1)

XXXXX E XXXXX E (row 1 column 2)

etc.

XXXXX E XXXXX E (row 3 column 3)

V 33 E (accept)

- 2. To load the components of [X] (preferred IMU orientation, see Inflight Alignment), the same sequence as in #1 could be used, except that the address instead of being 1733 should be 0306("X " = "UPBUFF" +2).
- 3. To load a CSM state vector update, the following sequence could be used:

V 71 E 21 E 1501 E (COMPNUMB = 17; "UPSVFLAG" = 3,1501)

0000x E (x = 1 for earth-centered, 2 for moon-centered)

XXXXX E XXXXX E R
Y-component

XXXXX E XXXXX E V
Y-component

XXXXX E XXXXX E V
Y-component

Z-component

XXXXX E XXXXX E T

X value

V 33 E (accept)

4. To load a LM state vector update, the same sequence as in #3 could be used, except that the UPSVFLAG setting, rather than being 00001 (earth) or 00002 (moon), should be 77776 or 77775 respectively.

5. To load an External Delta-V (P30) update, the following sequence could be used:

(COMPNUMB = 10; "DELVLVC" = 7,1404)V 71 E 12 E 3404 E

XXXXX E XXXXX E

DELVLVC

Y-component

Z-component XXXXX E XXXXX E

Tig

V 33 E

(accept)

6. To load an External Delta-V (P30) update for deorbit, the following sequence could be used:

V 71 E 16 E 3400 E (COMPNUMB = 14; "LATSPL" = 7,1400)

XXXXX E XXXXX E

LATSPL

XXXXX E XXXXX E

LNGSPL

(continue on

as in item #5)

- 7. To perform an update of merely the entry parameters, the sequence of #6 could be used, stopping after LNGSPL (hence first few quantities would be V 71 E 6 E 3400 E).
- 8. To load a landing site update, the following sequence could be used:

RLS

V 71 E 10 E 2025 E

(COMPNUMB = 8; "RLS" = 4,1425)

(see Coordinate Transformations)

XXXXX E XXXXX E

Y-component

Z-component

V 33 E

To load new values for erasable memory constants (such as IMU compensation parameters), see the list of cells in Erasable Memory Prelaunch Load (which is arranged in sequence of increasing addresses).

### Verb Definitions

#### VERBFAN

If (VERBREG - K<sub>st2cn</sub>) \( 0:

Proceed to address specified by  $K_{\mbox{vbt}}_{\mbox{VERBREG}}$ 

TS = VERBREG - K st2cn

Perform "RELDSP"

Proceed to address specified by  ${\rm K_{st2fn_{TS}}}$ 

## ALM/END

Set bit 7(Operator error) of channel ll = 1

Proceed to "PINBRNCH"

#### TESTXACT

If EXTVBACT > 0:

Proceed to "ALM/END"

If bits 14(PRIOIDLE), 12(PDSPFLAG), and 7(PROWTKEY) of FLAGWRD4  $\neq$  0:

Proceed to "ALM/END" (priority display using DSKY)

EXTVBACT =  $00024_8$  (sets bits 5 and 3 to 1)

TS = -2 and perform "NVSUB": if busy, proceed (blank R1-R3 otherwise, proceed and noun)

Check for new job waiting to be performed, and do it if required Return

# <u>VBTSTLTS</u> (verb 35)

If MODREG  $\neq$  0:

Proceed to "ALM/END"

Inhibit interrupts (released in "DELAYJOB" performance)

VBDF-1

Set bit 1(LMPTSTBT) of IMODES33 = 1

Set bits 7(Operator error), 6(Flash), 5(Key Release), 4(Temperature Caution), 3(Uplink Activity), and 1(ISS Warning) of channel 11 = 1

DSPTAB+11 = 00650 and flag for output at next opportunity
(bit 9 is Program alarm, bit 8 Tracker alarm, bit 6
Gimbal lock, and bit 4 No attitude) (Note if restart, "GOPROG"
put IMU into coarse align)

Set bit 10(Test DSKY lights) of channel 13 = 1

Set DSPTAB+O to DSPTAB+1O so that all registers display "8" and R1, R2, and R3 display plus signs, and flag for output at next opportunity

NOUT = 11

Delay K shots seconds (by putting job to sleep via "DELAYJOB")

Proceed to "TSTLTS3"

#### TSTLTS3

Set bits 7, 4, 3, and 1 of channel 11 = 0 (interrupts inhibited during routine)

Set bit 10 of channel 13 = 0

TS = bit 4(Coarse align) of channel 12

DSPTAB+11 = TS, and flag for output at next opportunity (bit 4 is No attitude) (Note that bit 9, Program alarm, set 0 even if FAILREG+0  $\neq$  0)

Set bit 1(LMPTSTBT) of IMODES33 = 0

Set bits 13-11 (PIP2FLBT, DNLKFAIL, UPLKFAIL) of IMODES33 = 1

Set bit 15(TLIMBIT) of IMODES30 = 0

Set bits 13, 12, and 10 (IMUFLBIT, ICDUFLBT, PIPAFLBT) of IMODES30 = 1

Set bit 7(OCDUFBIT) of OPTMODES = 1

Establish "DSPMMJB" (priority 308)

 $MONSAVE1 = 40000_{8}$  (sets bit 15 to 1)

Set bit 6(Flash) of channel 11 = 0

Perform "RELDSP"

If CADRSTOR  $\neq$  0:

Proceed to "PINBRNCH"

End of job

**VBZERO** (verb 40)

If IMUCADR  $\neq$  0:

Proceed to "ALM/END"

Perform "IMUZERO"

Perform "IMUSTALL": if error return, proceed otherwise, proceed

Proceed to "PINBRNCH"

VBCOARK (verb 41)

If NOUNREG  $\neq$  20:

(ICDU)

If NOUNREG  $\neq$  91:

(OCDU)

Proceed to "ALM/END"

If NOUNREG = 20:

Perform "TESTXACT"

(Tag here "IMUCOARK")

 $TS = 2522_{vn}$ 

Proceed to "GOXDSPF": if terminate, proceed to "ENDEXT" if proceed, proceed

otherwise, proceed

 $TS = 4100_{vn}$ 

Perform "EXDSPRET"

If IMUCADR  $\neq$  0:

Set bit 7(Operator error) of channel ll = 1

Proceed to "ENDEXT"

Perform "IMUCOARS"

Perform "IMUSTALL": if error return, proceed

otherwise, proceed

Proceed to "ENDEXT"

If MODREG  $\neq$  0:

(N91)

(Tag here "OPTCOARK")

Proceed to "ALM/END"

Perform "TESTXACT"

If SWSAMPLE <0: (switch not at computer position)

Set bit 7(Operator error) of channel 11 = 1

Perform "ALARM" (pattern Oll5g)

If OPTIND = -0: (Not expected in view of POO restriction)

Perform "ALARM" (pattern Oll7g)

Proceed to "ENDEXT"

 $TS = 2492_{vn}$ 

Proceed to "GOXDSPF": if terminate, proceed to "ENDEXT" if proceed, proceed otherwise, proceed

DESOPTS = SAC (loaded in Rl of N92)

DESOPTT = PAC (loaded in R2 of N92)

 $TS = 4100_{\rm vn}$ 

Perform "EXDSPRET"

OPTIND = 1

Proceed to "ENDEXT"

IMUFINEK (verb 42)

Perform "TESTXACT"

 $TS = 2593_{vn}$ 

Proceed to "GOXDSPF": if terminate, proceed to "ENDEXT" if proceed, proceed otherwise, proceed

 $TS = 4200_{vn}$ 

Perform "EXDSPRET"

If IMUCADR  $\neq$  0:

Set bit 7(Operator error) of channel ll = 1

Proceed to "ENDEXT"

Perform "IMUFINE"

Perform "IMUSTALL": if error return, proceed to "ENDEXT" otherwise, proceed

TS = "OGC"

Perform "IMUPULSE"

Perform "IMUSTALL": if error return, proceed otherwise, proceed

Proceed to "ENDEXT"

# IMUATTCK (verb 43)

If MODREG ≠ O, proceed to "ALM/END"

If bits 4-5 (IMU Coarse align, IMU Zero) of channel  $12 \neq 00_2$ :

Proceed to "ALM/END"

Perform "CKLFTBTS": if after liftoff, proceed if before liftoff, skip next line

Perform "TESTXACT"

Set bits 6(Enable CDU IMU Error Counters) and 4 (IMU Coarse Align) of channel 12 = 0

 $TS = 2522_{vn}$ 

Proceed to "GOXDSPF": if terminate, proceed to "TRMATTCK" if proceed, proceed otherwise, proceed

Perform "NEEDLE11"

Perform "NEEDLER2"

Call "ATTCK1" in 0.02 seconds

Proceed to "TRMATTCK"

## TRMATTCK

Perform "CKLFTBTS": if after liftoff, proceed to "ENDEXT" if before liftoff, proceed

Proceed to "PINBRNCH"

## **ATTCK1**

AK = THETAD

Perform "NEEDLES"

End of task

#### CKLFTBTS

If bit 5(BKUPLO) of FLAGWRD5 = 0:

If bit 5(Liftoff complement) of channel 30 = 1:

Return to calling address +2 (before liftoff)

Return to calling address +1 (after liftoff)

SETSURF (verb 44)

Set bit 8(SURFFLAG) of FLAGWRD8 = 1 (used e.g. in "INTEGRV" for selection of LM state vector computational scheme)

RESTSRF (verb 45)

Set bit 8(SURFFLAG) of FLAGWRD8 = 0

Proceed to "PINBRNCH"

STABLISH (verb 46)

See Digital Autopilot Interface Routines

LMTOCMSV (verb 47)

Establish "LMTOCM" (priority 10g)

End of job

#### LMTOCM

Perform "INTSTALL"

Set bit 12(CMOONFLG) of FLAGWRD8 = 1

If bit ll(LMOONFIG) of FLAGWRD8 = 0:

Set bit 12(CMOONFLG) of FLAGWRD8 = 0

TS = 0

Proceed to "V37"

#### Quantities in Computations

See also list of major variables and list of routines

 $A\underline{K}$ : See Digital Autopilot Interface Routines.

CADRSTOR: See Data Input/Output.

CPHIX: See Digital Autopilot RCS Routines.

DELTA $\underline{V}_{cm}$ , DELTA $\underline{V}_{lm}$ : See Orbital Integration.

DESOPTS, DESOPTT: See Optics Computations.

DNTMGOTO: See Telemetry.

EXTVBACT: Single precision cell several of whose bits are used to control various performance features of the extended verbs. If the cell is non-zero, this means that the "extended verb display system" is busy, and other users are locked out (hence the cell can be set non-zero deliberately to lock out other users). The individual bits are used as follows:

Bit		<u>Use</u>
-----	--	------------

- Set at start of "P61" and in "NEWRNVN" to inhibit extended verbs from using coding also used by P61 computations (e.g. R30 time-of-flight information).
- Bit set 1 at end of "COMPDISP", used in "R31CALL" (for R31 and R34) to delay start of first display until completion of loading of data cells.
- Bit set 1 by "TESTXACT", and used in "COMPDISP", "SBANDANT", "TICKTEST", and "V82GON1" to indicate, if 0, that a display response has been received (hence the cycling for updating of display should be stopped).
- Set 1 in "TESTXACT" to indicate that display system extended verb portion is "busy" (not in general set for those extended verbs that do not require use of the display system "mark/extended verb" priority).
- 2 Set l in "TESTMARK" to indicate that optics marking system is in use.

IMODES30, IMODES33: See IMU Computations.

IMUCADR: See IMU Computations.

K shots: Single precision constant, program notation "SHOLTS", scale factor Bl4, units centi-seconds. Value is 500 x 2-14, corresponding to 5 seconds.

K st2cn: Single precision constant, program notation "LST2CON", scale factor Bl4, value 40. VERBREG values of this amount or greater are considered "extended verbs".

K st2fn i giving (in the form of TC/TCF orders) starting addresses for processing of VERBREG values between K st2cn and 99. See table below.

K : Table of single precision addresses, program notation "VERBTAB", vbt i giving (in the form of CADR addresses) the starting addresses for processing of VERBREG values less than  $\rm K_{st2cn}.$  See table below.

LANDMARK: See Orbital and Rendezvous Navigation.

MONSAVEl: See Data Input/Output.

MPAC+O: See Display Interface Routines (loaded with verb that is received).

MRKBUF1: See Optics Computations.

NOUNREG: See Data Input/Output.

NOUT: See General Program Control.

NUMBNN: See Orbital and Rendezvous Navigation.

 $NU\underline{V}_{cm}$ ,  $NU\underline{V}_{lm}$ : See Orbital Integration.

OGC: See Coordinate Transformations (scale factor could be considered B21 in units of gyro pulses as well as BO revolutions): is loaded by N93.

OPTIND: See Optics Computations.

OPTIONX: See Display Computations.

OPTMODES: See Optics Computations.

PAC: See Coordinate Transformations (loaded by N92).

PBODY: See Orbital Integration.

 $\underline{\underline{R}}_{other}$ : See Orbital Integration.

 $\frac{R}{rectom}$ ,  $\frac{R}{rectlm}$ : See Orbital Integration.

 $RC\underline{V}$ ,  $RC\underline{V}_{cm}$ ,  $RC\underline{V}_{lm}$ : See Orbital Integration.

SAC: See Coordinate Transformations (loaded by N92).

SWSAMPLE: See Optics Computations.

Tccm, Tclm: See Orbital Integration.

 $T_{\rm et}$ ,  $T_{\rm etcm}$ ,  $T_{\rm etlm}$ : See Orbital Integration.

TDELTAY, TNUY: See Orbital Integration.

 $\underline{V}_{\text{other}}$ : See Orbital Integration.

Vrectom, Vrectlm: See Orbital Integration.

 $VC\underline{V}$ ,  $VC\underline{V}_{cm}$ ,  $VC\underline{V}_{lm}$ : See Orbital Integration.

VERBREG: See Data Input/Output.

 ${\tt XKEP}_{\tt cm}, {\tt XKEP}_{\tt lm} :$  See Orbital Integration.

# Verb Table Information

Verb	Starts at	Function
00	"DSPALARM"	Not assigned.
01	"DSPA"	Display in octal first component.
02	"DSPB"	Display in octal second component.
03	"DSPC"	Display in octal third component.
04	"DSPAB"	Display in octal first and second components.
05	"DSPABC"	Display in octal all three components.
06	"DECDSP"	Decimal display.
07	"DSPDPDEC"	Double precision decimal display.
08-10	"DSPALARM"	Not assigned.
11-17	"MONITOR"	Perform monitor function of type specified by least significant digit of verb (e.g. verb 13 does "DSPC" periodically).
18-20	"DSPALARM"	Not assigned.
21	"ALOAD"	Load first component.
22	"BLOAD"	Load second component.
23	"CLOAD"	Load third component.
24	"ABLOAD"	Load first and second components.
25	"ABCLOAD"	Load all three components.
26	"DSPALARM"	Not assigned.
27	"DSPFMEM"	Display contents of fixed memory.
28-29	"DSPALARM"	Not assigned.
30	"VBRQEXEC"	Request executive system (for a job).
31	"VBRQWAIT"	Request waitlist system (for a task).
32	"VBRESEQ"	Recycle verb (same calling-routine return as a data enter).
33	"VBPROC"	Proceed (without data) verb.

Verb	Starts at	<u>Function</u>
34	"VBTERM"	Terminate (activity or function) verb.
35	"VBTSTLTS"	Test lights of display system.
36	"SLAP1"	Perform a (manually initiated) fresh start.
37	"MMCHANG"	Change program ("major mode").
38-39	"DSPALARM"	Not assigned.
40	"VBZERO"	Zero IMU CDU's.
41	''VBCOARK''	Coarse align (IMU CDU N2O; optics CDU N91).
42	"IMUFINEK"	Fine align IMU (optional pulse torquing).
43	"IMUATTCK"	Load FDAI attitude error needles.
44	"SETSURF"	Set surface flag (LM state vector).
45	"RESTSRF"	Reset surface flag (LM state vector).
46	"STABLISH"	Establish G&C (DAP) control.
47	"LMTOCMSV"	Move LM state vector into CSM state vector.
48	"DAPDISP"	Load DAP data (RO3).
49	"CREWMANU"	Start crew-defined maneuver (R62).
50	"GOLOADLV"	Please perform.
51	"GOLOADLV"	Please mark.
52	"V52"	Set offset mark number for P22.
53	"GOLOADLV"	Please mark alternate LOS.
54	"GOTOR23"	Start rendezvous backup sighting mark routine (R23).
55	"ALINTIME"	Increment computer clock (decimal input data).
56	''TRACKTRM''	Terminate tracking (P20).
57	"V57CALL"	Select FULTKFIG option (number of sensors).
58	"ENATMA"	Enable automatic attitude maneuvers in R61 and R67.
59	''GOLOADLV''	Please mark (optics calibration).

Verb	Starts at	Function
60	''V60''	Set $CPHIX (N17) = CDU (N20)$ .
61	''V61''	Display autopilot following error (RCS DAP "Mode I") on FDAI error needles.
62	"V62"	Display autopilot total attitude error with respect to N22 (RCS DAP "Mode II") on FDAI error needles.
63	"V63"	Display autopilot total attitude error with respect to N17 (RCS DAP "Mode III") on FDAI error needles.
64	''VB64''	Start S-band antenna angle calculation (RO5).
65	"CKOPTVB"	Optical verification of prelaunch alignment (PO3).
66	"ATTACHED"	Move CSM state vector into LM state vector.
67	''V67''	Start W-matrix RSS error display.
68	"ALM/END"	Not assigned.
69	(one-step loop)	Cause a hardware restart (one-step loop).
70	"V7OUPDAT"	Liftoff time update (P27).
71	"V71UPDAT"	Block address update (P27).
72	"V72UPDAT"	Single address update (P27).
73	''V73UPDAT''	Increment computer clock (P27). Input is in units of centi-seconds, as contrasted with the hours, minutes, seconds input of V55.
74	"DNEDUMP"	Initialize downlink erasable memory dump.
75	"LFTFLGON"	Set liftoff flag (for backup liftoff).
76	"ALM/END"	Not assigned.
77	"ALM/END"	Not assigned.
78	"CHAZFOGC"	Change gyrocompass launch azimuth.
79	"ALM/END"	Not assigned.

<u>Verb</u>	Starts at	<u>Function</u>
80	"LEMVEC"	Cause LM state vector to be updated by navigation measurements (in P20).
81	"CSMVEC"	Cause CSM state vector to be updated by navigation measurements (in P20).
82	"V82PERF"	Request orbital parameter display (R30).
83	"V83PERF"	Request rendezvous parameter display #1 (R31, +X axis angle).
84	"ALM/END"	Not assigned (R32 is now P76).
85	''V85PERF''	Request rendezvous parameter display #2 (R34, optics angle).
86	"V86PERF"	Reject rendezvous backup sighting mark.
87	"SETVHFLG"	Set VHF range flag (for R22).
88	"RESETVHF"	Reset VHF range flag (for R22).
89	"V89PERF"	Start rendezvous final attitude routine (R63).
90	"V90PERF"	Request rendezvous out-of-plane display (R36).
91	"GOSHOSUM"	Compute banksums (of each fixed memory bank).
92	"ALM/END"	Not assigned.
93	''WMATRXNG''	Reset both W matrix flags (RENDWFIG and ORBWFLAG) to enable initialization.
94	"VERB94"	Enable cislunar tracking recycle (P23).
95	"ALM/END"	Not assigned.
96	"VERB96"	Terminate integration and go to POO.
97	"GOLOADLV"	Please perform engine-fail logic (R40).
98	"ALM/END"	Not assigned.
99	"GOLOADLV"	Please enable engine ignition.

## Index of Routines

The routines listed below are those included by specific tag in this document. They are arranged in the "alphabetical" order of the listing of symbols at the end of the program: "+", "\*", "-", A-Z, and O-9.

#### Quantities in Computations

See also list of major variables and list of routines

AGEOFW: See Measurement Incorporation.

- AUTPOINT: Single precision cell used for return address storage in the minimum key rendezvous logic. It could be considered as a "pointer" indicating the progress of the computations through the P8x "driver".
- AUTTEMP: Single precision cell used as temporary storage for information to be placed in AUTPOINT (to simplify some program logic and for the sake of restart protection).
- AZIMANGL: See Orbital and Rendezvous Navigation.
- BURNTMP1, BURNTMP2, BURNTMP3, BURNTMP4: Cells used for temporary storage of active and passive vehicle vectors in "HARTBURN" (to allow them to be exchanged without causing difficulty in the event of a restart).
- Cbrnblktm: Single precision erasable memory constant, program notation "BRNBLKTM", scale factor B28, units centi-seconds. Least increment is 163.84 seconds. Used in the determination of age of W matrix following next maneuver (typical value when in fixed memory was 5 least increments), for C check. Five increments about 13.653'.
- Cfincmptm: Single precision erasable memory constant, program notation "FINCMPTM", scale factor B28, units centi-seconds. Least increment is 163.84 seconds. Used to allow for length of time of final targeting computation (typical value when in fixed memory was 3 least increments), e.g. for Ctbefcomp check. Three increments about 8.192'.
- Cmaxwtime: Single precision erasable memory constant, program notation "MAXWTIME", scale factor B28, units centi-seconds. Least increment is 163.84 seconds. Used to determine if W matrix age will be excessive after next maneuver (typical value when in fixed memory was 22 least increments, or about 60.075 minutes).
- Cminblktm: Single precision erasable memory constant, program notation "MINBLKTM", scale factor B28, units centi-seconds. Least increment is 163.84 seconds. Used to check whether time since last mark excessive (if so, COUNT3MK is set 1). Typical value when in fixed memory was 2 least increments, or about 5.461 minutes.
- Ctbefcomp: Single precision erasable memory constant, program notation "TBEFCOMP", scale factor B28, units centi-seconds. Least increment is 163.84 seconds. Used to check if a sufficient time remains before the final targeting computation so that W matrix reinitialization should take place. Typical value when in fixed memory was 5 least increments, or about 13.653 minutes.

C wrdtime: Single precision erasable memory constant, program notation "WRDTIME", scale factor B28, units centi-seconds. Least increment is 163.84 seconds. Used to check if sufficient time has elapsed since the previous W matrix initialization. Typical value when in fixed memory was 9 least increments, or about 24.576 minutes(recently ~41 min).

CMYDOT: See Burn Control.

COUNT3MK: Single precision counter, scale factor B14, units counts, used to control the initialization of the W matrix after three marks accumulated (hence the name). It is incremented in "REND12", where it is also set zero after reaching 3. If non-zero, checks in "AUTOW", except immediately following a burn, are bypassed.

DELVEET2: See Rendezvous Computations.

DELVLVC: See Burn Control.

DELVOY: See Burn Control.

K<sub>3mincon</sub>: Single precision constant, program notation "3MINCON", scale factor B28, units centi-seconds. Used double precision with octal value 00001<sub>8</sub> 00002<sub>8</sub>, corresponding to 163.86 seconds or 2.731 minutes.

 $^{\rm K}$ dv40d41: Constant, program notation "DV40/41", scale factor B7, units meters/centi-second. Value is 0.021336 x  $2^{-7}$ , corresponding to 7 x 0.3048 x 0.01 x  $2^{-7}$ , where first term is value in fps, second converts to meters, third to centi-seconds, and fourth is scale factor.

LMYDOT: See Burn Control.

MARKTIME: See Measurement Incorporation.

MMNUMBER: See General Program Control.

NN1: See Rendezvous Computations.

NOMTIG: See Burn Control.

OLDMKTME: See Measurement Incorporation.

 $\frac{R}{actl}$ ,  $\frac{R}{act3}$ ,  $\frac{R}{pass3}$ : See Rendezvous Computations.

Rtarg: See Rendezvous Computations. Used in "P82" as temporary storage for restart protection purposes (scaling, of course, is BL4 for Rtarg there).

Tcdh, Tcsi, Tcsi2: See Rendezvous Computations.

TEMPMM: Temporary storage for program number to be used in searching the program tables in V37 logic (in range 81-86, or 79 if that program selected), scale factor B14, single precision. Used in "REND3OS" to allow start-up of P20 and then initiation of desired program.

ULOS: See Rendezvous Computations.

 ${\tt UNR\underline{M}:}$  See Rendezvous Computations.

UP1: See Rendezvous Computations.

UTPIT: See Orbital and Rendezvous Navigation.

 $\underline{V}_{act3}$ ,  $\underline{V}_{pass3}$ : See Rendezvous Computations.

 $\underline{X}_{smd}$ ,  $\underline{Y}_{smd}$ ,  $\underline{Z}_{smd}$ : See Inflight Alignment.

#### Noun Definitions

#### DPTEST

If TS<sub>1</sub> = 4, 5, 7, 10, or 13, indicate double precision (return to calling address +2)

If TS<sub>1</sub> = 0, 1, 2, 3, 6, 8, 9, 11, or 12, indicate single precision (return to calling address +1)

### GTSFOUT

 $SFTEMPl = K_{sfot_{TS}}$ 

Return

#### Quantities in Computations

See also list of major variables and list of routines

CODE, COUNT: See Data Input/Output.

DECBRNCH, DECOUNT, DECRET: See Data Input/Output.

DSPCOUNT: See Data Input/Output.

EBANK, ENTRET: See Data Input/Output.

- HITEMOUT: Value of number of minutes in time quantity (computed in "SEPSECNR" for use in "SEPMIN"), scale factor Bl6, units minutes. Least significant 12 bits of least significant half contain fractional portion of minutes, and therefore must be blanked in "SEPMIN" for proper computation of the number of integral minutes in the time argument. Least significant half "LOTEMOUT".
- IDADITEM ( $\underline{I} = 1,2,3$ ): Temporary storage for information from mixed-noun tables (see below) for first (R1), second (R2), and third (R3) components of noun. The R1 component, of course, is displayed in register R1 on the DSKY, etc.
- K<sub>20b</sub>: Single precision constant, program notation "20BIAS", scale factor B-3, units revolutions. Octal value is 160408, corresponding to about 19.7754°.
- K<sub>59min</sub>: Single precision constant, program notation "59MIN", scale factor Bl4, units minutes. Value is 00073<sub>8</sub>, corresponding to 59 minutes.
- K<sub>5999sc</sub>: Single precision constant, program notation "59.99SEC", scale factor Bl4, units centi-seconds. Value is 13557<sub>8</sub>, corresponding to 5999 centi-seconds (or 59.99 seconds).
- $K_{\rm btll}$ : Single precision constant, program notation "BITIL". As used, value corresponds to  $(\frac{1}{2} \times 2^{-1/4})$  of full scale, or one-half the least increment on the single precision result for "DEGINSF".
- $K_{\rm btl2}$ : Single precision constant, program notation "BIT12". As used, value corresponds to  $(\frac{1}{2} \times 2^{-14})$  of full scale, or one-half the least increment on the single precision result for "OPTDEGIN".
- $^{
  m K}$ dgcnl: Constant, program notation "DEGCON1", scale factor B3, value 5.555555555 x  $2^{-3}$ . Value corresponds to (1000/180) x  $2^{-3}$ , where first term converts from XXX.XX° to B-1 revolutions, and second is the constant's scale factor.

- $K_{\rm dgcn2}$ : Constant, program notation "DEGCON2", scale factor B2, value 2.222222222 x 2<sup>-2</sup>. Value corresponds to (100/45) x 2<sup>-2</sup>, where first term converts from XX.XXX° to B-3 revolutions, and second is the constant's scale factor.
- $^{\rm K}_{\rm dgtb_005605_8}$  : Constant, program notation "DEGTAB", scale factor BO, octal value to 180/1000, to convert from B-l revolutions to XXX.XX°.
- K<sub>dgtb2</sub>: Constant, program notation "DEGTAB +2", scale factor BO, octal value 163148 314638, corresponding to decimal 0.45. Value equivalent to 45/100, to convert from B-3 revolutions to XX.XXX°.
- $K_{\text{himin}}$ : Single precision constant, program notation "HIMINCON", scale factor BO, value 233468. Value corresponds to (0.6 + 2-7).
- $K_{\rm hisec}$ : Single precision constant, program notation "HISECON", scale factor BO, value 231478. Value corresponds to (0.6 + 2<sup>-14</sup>).
- $\rm K_{hrcn1}$ : Constant, program notation "HRCON1", scale factor B-14, value 0.16384. Value corresponds to 10<sup>-5</sup> x 2<sup>1</sup>/<sub>4</sub>.
- K<sub>hrcon</sub>: Constant, program notation "HRCON", scale factor B28, units centi-seconds. Value is 00025<sub>8</sub> 37100<sub>8</sub>, corresponding to 360,000 (or 3600 seconds).
- $K_{\rm idtb}$ : Table of constants for mixed noun information, program notation i "IDADDTAB", giving address and scaling routine information. See information below.
- K<sub>mincon</sub>: Single precision constant, program notation "MINCON", scale factor BL4, units centi-seconds. Value is 13560<sub>8</sub>, corresponding to decimal 6000 (or 60 seconds).
- $K_{\rm mncn1}$ : Constant, program notation "MINCON1", scale factor B-2, value 02104, 104228, corresponding to ( 1/60 x  $2^2$  +  $2^{-28}$ ), to give hours scaled B14 in MPAC+0 when return from "SEPMIN" (and fraction of an hour, B0, in MPAC+1).
- $\rm K_{mncn2}$ : Constant, program notation "MINCON2", scale factor BO, value 0000118 324458. Value corresponds to 60 x 10-5.
- K<sub>mscn3</sub>: Constant, program notation "M/SCON3", scale factor B28, units centi-seconds. Value is 00025<sub>8</sub> 37016<sub>8</sub>, corresponding to 359,950 centi-seconds (or 59 minutes 59.5 seconds).

- K<sub>mscn12</sub>: Notation assigned to effect in program of constants "M/SCON1" and "M/SCON2", both single precision with octal values 777538 and 411268 respectively. The constants information, for program convenience, is stored in negative form (with magnitude of each decremented by one least increment for convenience in forming the absolute value). The net effective value in the program of the combined constant (scale factor B28, units centi-seconds) is 000258 366528, corresponding to 359,850 centi-seconds (59 minutes 58.5 seconds). A value of time of this value or more would be displayed in "M/SOUT" as 59 59, with appropriate sign.
- K<sub>mxcn</sub>: Single precision constant, program notation "MIXCON", scale factor B14, value 00050g, corresponding to a noun of 40. Nouns of this value or above are considered "mixed nouns".
- $K_{ngl}$ : Single precision constant, program notation "NEGl", scale factor B-3, units revolutions, used to convert from twos complement to ones complement information. Value is  $-2^{-1/4}$  (minus one least increment).
- $m K_{ngp2}$ : Single precision constant, program notation "NEG.2", value 71527g. Octal value equivalent to 6250g: since the constant is added to information scaled XX.XXX°, value corresponds to 100 x (- 0.197754), or 19.7754° (cf.  $\rm K_{20b}$ ).
- ${
  m K}_{
  m ntb}$ : Table of constants, program notation "NNADTAB", for loading i NNADTEM. See information below.
- Knty: Table of constants, program notation "NNTYPTAB", for loading NNTYPTEM. See information below.
- $K_{rd_T}$ : See Data Input/Output.
- Krnden: Constant, program notation "RNDCON -1", scale factor B28, units centi-seconds. Value is 00000<sub>8</sub> 00062<sub>8</sub>, corresponding to 50 centi-seconds (0.5 second).
- Krtmtb: Table of constants used to specify scaling routines for mixed inouns, program notation "RUTMXTAB". See information below (is used to load RUTMXTEM). First table cell is for noun 40.
- $K_{\rm scnl}$ : Constant, program notation "SECON1", scale factor B-12, value 1.66666666E-4 x  $2^{12}$ , corresponding to (1/6000) x  $2^{12}$ (to convert centi-seconds scaled B28 to minutes scaled B16, cf. HITEMOUT).
- $\rm ^{K}_{scn2}$ : Constant, program notation "SECON2", scale factor BO, value 017278 012178. Value corresponds to 60 x 10^-3.

- $\rm K_{sfin_0}$ : First of a set of input constants selected in "GTSFIN", located in consecutive cells starting at "SFINTAB". Value is 000068 032408, scale factor B28. Value corresponds to  $10^5 \times 2^{-28}$ , to convert from the fraction produced by "NUM" to an integer with scale factor B28.
- $\mathbf{K}_{\text{sfin}_1}$ : Constant, value 0, not assigned.
- ${
  m K}_{
  m sfin}_2$ : Constant, value O, used to set initial condition for SFTEMPl for use in "DEGINSF" and "OPDEGIN". The scaling routine itself selects the appropriate scaling constants.
- K<sub>sfin3</sub>: Constant, value 10707<sub>8</sub> 03435<sub>8</sub>, scale factor BO. Value corresponds to one least increment more than (100 x 1/360), to convert from an input of XX.XXX° to BO revolutions. Since there are 2<sup>21</sup> gyro pulses per revolution, the constant could also be considered to convert to gyro pulses, scale factor B21.
- $K_{sfin_4}$ : Constant, scale factor B3, value 13070 343458. Value corresponds to one least increment more than (1000 x 1/360) x 2<sup>-3</sup>, to convert from XXX.XX° to B3 revolutions (hence use Routine #10, "DPINSF4", to shift result left 3 for a scaling of B0 revolutions).
- $K_{sfin_5}$ : Constant, value 000058 216168, scale factor B14. Value corresponds to (1000 x 1/180) x 2-14, to convert from XXX.XX° to B-1 revolutions (after performing a left shift of 14). Not used.
- K sfin corresponds to  $10^5 \times 0.45359237 \times 2^{-16}$ , to convert between XXXXX. pounds and Bl6 kilograms (single precision).
- $^{\rm K}$  : Constant, value 00070, 20460, scale factor BO. Value 7 corresponds to  $10^3$  x 1852 x  $2^{829}$ , to convert between XXX.XX nmi and meters scaled B29 (there are 1852 meters in a nautical mile).
- $^{\rm K}$  sfin corresponds to 10  $^4$  x 1852 x 2  $^2$  29, to convert between XXXX.X nmi and meters scaled B29 (there are 1852 meters in a nautical mile). See  $^{\rm K}$  sfot
- K sfin : Constant, value 11414, 31463, scale factor B3. Value 9 corresponds to  $10^5 \times 10^{-2} \times 0.3048 \times 2^{-7} \times 2^{-3}$ , for the net value to convert from XXXXX. feet/second to B10 meters/centi-second (hence use Routine #10, "DPINSF4", to shift result left 3 for scaling of B7 meters/centi-second).

- $^{
  m K}_{
  m sfin}_{
  m 10}$ : Constant, value 074758 160518, scale factor BO. Value corresponds to  $10^4$  x  $10^{-2}$  x 0.3048 x  $2^{-7}$ , in order to convert between XXXX.X fps and meters/centi-second with scale factor B7.
- $K_{\rm sfin}$ : Constant, value 00001<sub>8</sub> 03434<sub>8</sub>, scale factor B14. Value corresponds to  $10^2$  x (1/90) x  $2^{-14}$ , to convert from XX.XXX° to B-2 revolutions (after performing a left shift of 14 via Routine #3, "ARTHINSF").
- \*\*Sfin : Constant, value 00002, 222458, scale factor B14. Value 12 corresponds to 10<sup>3</sup> x (3600/85.41) x 2<sup>-14</sup> x 2<sup>-14</sup> minus one least increment, to convert between XXX.XX° and B14 "CDU actuator pulses" (after performing a left shift of 14 via Routine #3, "ARTHINSF"). There are 85.41 arc seconds per CDU actuator pulse.
- K : Constant, value 00014, 35607, scale factor B14. Value 13corresponds to 107 x 1.355817948 x 2-20 x 2-14, to convert between XXXXXbb. slug-feet<sup>2</sup> and B20 kilogram-meters<sup>2</sup> (after performing a left shift of 14 via Routine #3, "ARTHINSF"). The "bb" means that the input is in units of 100 slug-feet<sup>2</sup>. Same constant could also be used to convert between XXXXXbb. foot-pounds and B20 newton-meters. Constant is not used (since functions are computed in "FIXCW" as determined from inputs of vehicle mass).
- K sfin : Constant, value 07606 06300 , scale factor B3. Value 14 corresponds to one least increment more than  $10^5$  x  $(1/25766.1973) \times 2^{-1} \times 2^{-3}$ , to convert between XXXXX. fps and B1 VSAT units (used in entry, where 1 VSAT = 25766.1973 fps), after performing a left shift of 3 via Routine #10, "DPINSF4".
- $^{\rm K}$  : Constant, value 16631 11307g, scale factor BO. Value  $^{\rm 15}$  corresponds to  $10^4$  x (1/21622.4965), to convert between XXXX.X nmi and BO revolutions. The denominator conversion value corresponds to  $2\pi$  x 6373338 / 1852, i.e. an earth radius equal to the value of K (see Burn Control) used to derive circumference.
- K : Constant, value 12000, 00000, scale factor B7. Value 16 corresponds to 10<sup>3</sup> x (1/25) x 2<sup>-7</sup>, to convert between XXX.XX g's and B0 "G-units" (25 g's, as used in Entry Computations), after performing a left shift of 7 via Routine #5, "DPINSF2".
- K : Constant, value 27176, 14235, scale factor BO. Value 17 corresponds to  $10^4$  x (1/3441.3272) x  $2^{-2}$ , to convert between XXXX.X nmi and radians scaled B2 (using the pad radius given for K ).

- K sfin : Constant, value 30480 x  $2^{-19}$ , scale factor BO. Value 18 corresponds to  $10^5$  x 0.3048 x  $2^{-19}$ , to convert between XXXXX. feet and meters scaled B19 (there are 0.3048 meters in one foot).
- K : Constant, value 30.48 x  $2^{-7}$ , scale factor B7. Value 19 corresponds to  $10^4$  x 0.3048 x  $10^{-2}$  x  $2^5$  x  $2^{-7}$ , to convert between XXXX.X fps and B0 meters/centi-second (first term is for XXXX.X fps, second converts to meters, third converts to centi-seconds, fourth is for scaling of final answer, and fifth is scale factor of constant), after a left shift of 7 via Routine #5, "DPINSF2".
- $K_{\rm sfot}$ : First of a set of output constants selected in "GTSFOUT", located in consecutive cells starting at "SFOUTAB". Value is 05174g 13261g, scale factor BO, with value corresponding to 10<sup>-5</sup> x 2<sup>14</sup>, to convert from an integer with scale factor B14 to XXXXX.
- $K_{\text{sfot}_1}$ : Constant, value 0, not assigned.
- Ksfot<sub>2</sub>: Constant, value O, used to load SFTEMP1 with proper initial value for use in "DEGOUTSF" and "OPDEGOUT".
- K : Constant, value 00714, 31463, scale factor B7. Value sfot 3 corresponds to (360)  $\times$  10<sup>-2</sup>  $\times$  2<sup>-7</sup>, to convert from B0 revolutions to XX.XXX<sup>0</sup>. Since there are 2<sup>21</sup> gyro pulses per revolution, the constant could also be considered to convert from gyro pulses scaled B21.
- K sfot corresponds to (360)  $\times$  10<sup>-3</sup>, to convert from BO revolutions to XXX.XX<sup>o</sup>.
- K sfot 5 corresponds to (180) x  $10^{-3}$ , to convert from B-1 revolutions to XXX.XX<sup>0</sup>. Constant is not used.
- K : Constant, value 00001, 16170, scale factor B14. Value sfot 6 corresponds to  $2^{16}$  x (1/0.45359237) x  $10^{-5}$  x  $2^{-14}$ , to convert between B16 kilograms and XXXXX. pounds.
- K : Constant, value 00441, 34306, scale factor B14. Value sfot7 corresponds to  $2^{29} \times (1/1852)^8 \times 10^{-3} \times 2^{-14}$ , to convert between B29 meters and XXX.XX nmi.
- K : Constant, value 07176, 21603, scale factor B7. Value sfot 8 corresponds to (2<sup>29</sup>) x (1/1852) x 10<sup>-4</sup> x 2<sup>-7</sup>, to convert between B29 meters and XXXX.X nmi (there are 1852 meters in a nautical mile). For N73, converts from units of meters/100 (computed by P21) to XXXXXb. nmi.

- $^{\rm K}$  sfot 9 two halves of constant is correct). Value corresponds to (100 x  $^{27}/_{0.3048}$ ) x  $^{10-5}$ , to convert from the navigation scaling of velocity (B7 meters/centi-second) to XXXXX. fps.
- K : Constant, value 01031, 21032, scale factor B7. Value 10 corresponds to (100 x 27/0.3048) x 10<sup>-4</sup> x 2<sup>-7</sup> plus one least increment, to convert from the navigation scaling of velocity (B7 meters/centi-second) to XXXX.X fps.
- K sfot : Constant, value 34631, 23146, scale factor BO. Value corresponds to (90) x 10<sup>-2</sup>, to convert from B-2 revolutions to XX.XXX<sup>o</sup>.
- K : Constant, value 14340, 241458, scale factor BO. Value 12 corresponds to  $(85.41/3600) \times 2^{14} \times 10^{-3}$ , to convert between B14 "CDU actuator pulses" and XXX.XX°. There are 85.41 arc seconds per CDU actuator pulse.
- K sfot : Constant, value 023638 037218, scale factor BO. Value 13 corresponds to  $2^{20} \times (1/1.355817948) \times 10^{-7}$ , to convert between B20 kilogram-meters and XXXXXbb. slug-feet (the "bb" means that output is in units of 100 slug-feet). Same constant could also be used to convert between B20 newton-meters and XXXXXbb. foot-pounds. Constant is not used (see K sfin ).
- K sfot : Constant, value 203738 021228, scale factor BO. Value 14 corresponds to  $2^1 \times 25766.1973 \times 10^{-5}$ , to convert between B1 VSAT units and XXXXX. fps (one VSAT is 25766.1973 fps, used in entry).
- K sfot: Constant, value 00424, 30446, scale factor B7. Value 15 corresponds to 21622.4965 x  $10^{-4}$  x  $2^{-7}$ , to convert between B0 revolutions and XXXX.X nmi (see K sfin 15
- K : Constant, value 00631 231468, scale factor BO. Value 16 corresponds to 25 x 1083, to convert between BO "G-units" (25 g's, as used in entry computations) and XXX.XX g's.
- $^{\rm K}$  : Constant, value 00260, 06213, scale factor B7. Value 17 corresponds to 3441.3272 x  $2^{28}$  x  $10^{-4}$  x  $2^{-7}$ , to convert between B2 radians and XXXX.X nmi (using pad radius, see  $^{\rm K}$  ).
- $K_{\rm sfot}$ : Constant, value 17.2010499 x  $2^{-7}$ , scale factor B7. Value 18 corresponds to  $2^{19}$  x (1/0.3048) x  $10^{-5}$  x  $2^{-7}$ , to convert between B19 meters and XXXXX. feet (with a left shift of 7 places due to scaling of constant).

- K : Constant, value 0.032808399, scale factor BO. Value sfot 19 corresponds to  $2^0 \times 10^2 \times (1/0.3048) \times 10^{-4}$ , to convert between BO meters/centi-second and XXXX.X fps: first term is for original scaling, second converts to seconds, third converts to feet, and fourth is display scale.
- K whecon: Constant, program notation "WHOLECON", value 00006 032408, scale factor B28. Value corresponds to  $10^5$  x  $2^{-28}$ 8 (to "compensate" for the scaling done in "NUM").
- MIXBR: Single precision cell, scale factor Bl4, set in "LODNNTAB" to l for a "normal" noun and to 2 for a "mixed" noun.
- NNADTEM: Temporary storage cell, single precision, loaded in "LODNNTAB" with the value of  $K_{\rm ntb}_{\rm I}$  corresponding to NOUNREG contents. See information below.
- NNTYPTEM: Temporary storage cell, single precision, loaded in "LODNNTAB" with the value of  $K_{\rm nty}$  corresponding to NOUNREG contents. See information below.

NOUNADD, NOUNREG: See Data Input/Output.

OVFINP: See Data Input/Output.

- RUTMXTEM: Temporary storage cell, single precision, loaded in "LODNNTAB" with value of  $K_{\rm rtmtb}_{\rm T}$  for "mixed nouns" only. See information below.
- SFTEMPl: Temporary storage cell used to contain the appropriate value of  $K_{sfin_{\underline{I}}}$  or  $K_{sfot_{\underline{I}}}$ , used for angle bias information (if any) in "DEGOUTSF" and "OPDEGOUT".

VERBSAVE: See Data Input/Output.

YREG, YREGLP: See Data Input/Output (YREGLP described for LPREG).

ZREG, ZREGLP: See Data Input/Output (ZREGLP described for LPREG).

#### Noun Table Interpretation

# "Normal" Nouns MIXBR = 1

Knty bits 15-11 contain the "component code number", interpreted as follows:

Bit 15 is 1 if no loading of information by use of the noun with verbs 24 or 25 is allowed.

Bit 14 is 1 if only decimal input/output by use of the noun is allowed (i.e. no octal verbs may be used).

Bit 13 is not assigned.

Bits 12-11 give information on the number of components:

00<sub>2</sub> for one component

Ol<sub>2</sub> for two components

102 for three components

Knty bits 10-6 contain the "scale factor routine code number", used in "DECDSP3" and "PUTDCSF2" to transfer to the proper scaling routine.

Knty bits 5-1 contain the "scale factor constant code number", used in "GTSFOUT" and "GTSFIN" to select the proper scaling constant.

 $K_{\mathrm{ntb}}$  gives the machine address information with the following interpretations:

- +0 if noun not assigned.
- -O if previous address to be incremented by +1.
- -l if a channel is to be loaded or read (channel number is supplied as another input).
- <-l (usually 40000g) if an octal erasable memory address is
  to be supplied as another input.</pre>
- >+0 if the octal erasable memory address is given (for the first component).

# "Mixed" Nouns MIXBR = 2

- $K_{\rm nty}$  bits 5-1, 10-6, and 15-11 contain the "scale factor constant code number", used in "GTSFOUT" and "GTSFIN", for component #1, #2, and #3 respectively.
- $\rm K_{ntb}$  bits 15-11 contain the "component code number", with the same bit assignments as for bits 15-11 of  $\rm K_{nty}$  for normal nouns.
- $K_{\rm ntb}$  bits 10-1 contain the relative address (with respect to the start of the  $K_{\rm idtb}$  table, program notation "IDADDTAB") of the information in that table for the first component of the noun. Is 3(NOUNREG -40).
- K gives the octal erasable memory address for the individual component (if the noun is three components, three consecutive cells are used).
- $K_{\rm rtmtb}$  bits 5-1, 10-6, and 15-11 contain the "scale factor routine code number", used in "DECDSP3" and "PUTDCSF2", for component #1, #2, and #3 respectively.

## Notes for Noun Table Information

- 1. A decimal display of "hr,mn,sc" appears as: 00XXX. hr 000XX. mn 0XX.XX sc
- 2. A decimal single-register display of "mn, ,sc" appears with minutes in the first two digits of the register and seconds in the last two digits. The middle (third) digit is blank. Maximum magnitude is 59 59.
- 3. Vector-type quantities are displayed with the first (e.g. X) component in R1, the second component in R2, and the third in R3.
- 4. Single component nouns appear in Rl only.
- 5. If an output quantity is larger than the capacity of the display register scaling, it generally will be displayed modulo that capacity: this assumes, of course, that the basic cell itself as stored in memory has not overflowed. If velocity increment of 12000 fps experienced on an XXXX.X fps scale for display, it would be expected to show 2000(.)0. This arises from the fact that the K constants convert the information into the range 0 0.99999, with subsequent display output generated by multiplying by 10 and using the integral part of the result (in "DSPDCWD1"). Multiplication by the K constant takes place before any scaling shifts.

# Noun Table Information

Nour	<u>Cell</u>	No D	ec.	Num- ber	Rou- tine	Con- stant	Decimal Display	Quantity

# Internal Noun Uses

Listed below are the routines which cause the values of particular nouns to be displayed, together with the associated verb used for the initial display generation (which is sometimes written over with another verb).

Noun	<u>Using Routine (Verb)</u>
Ol	"OHWELL1" (21); "OHWELL2" (21); "SOPTION" (05)
02	"UPVERIFY" (21)
03	Manual initiation only (angle data, address-to-be-specified)
05	"R54" (06)
06	See Checklist and Option Codes
07	Manual initiation only (with V25, to change flag/channel bits)
08	Manual initiation only (Alarm data)
09	See the "D" Error Codes (used with VO5)
10	Manual initiation only (channel-to-be-specified)
11	"P31" (06); "P72" (06)
12	See Checklist and Option Codes
13	"P73" (06)
14	"P15J0B" (06)
15	Manual initiation only (increment machine address)
16	"R36" (06); "V82GOFF1" (06)
17	Manual initiation only (V63 FDAI base angles)
18	"TOBALL" (06); "TOBALL" (06 replaced by 50); "V89RECL" (06)
20	"GYCRS" (16)
21	Manual initiation only (PIPA)
22	"IMUATTCK" (25); "P51A" (06); "P52D" (06); "P62.1" (06); "R62DISP" (06); "UPCONTRL" (06); "VBCOARK" (25)
24	"ALINTIME" (25)
25	See Checklist and Option Codes

Noun	Using Routine (Verb)
26	Manual initiation only (verb 30 and 31 parameters)
27	Manual initiation only (computer self-test switch)
29	"AZMTHCGl" (06)
30	"GCOMPVER" (05, written over by VO6N41)
31	Manual initiation only (time of last $r/v$ W matrix initialization)
32	Manual initiation only (time from pericenter computed in R30)
33	"P15JOB" (06); "P30" (06); "P31" (06); "P36A" (06); "P37" (06); "P37E" (06); "P76ER77" (06)
34	"PASSOUT" (06); "P200PT" (06); "P21PROG1" (06); "P52B" (06)
35	Manual initiation only (h,m,s display of e.g. Rl of N40)
36	Manual initiation only (computer clock)
37	"P31" (06); "P34/P74C" (06); "P72" (06); "P74" (06)
38	Manual initiation only (state vector time, $T_{et}$ )
39	''RTEVN'' (06)
40	"CLOCKJOB" (06 replaced by 97 or 99); "POSTBURN" (16); "P4OSXTY" (06); "TIG-O" (06); "TIGAVEG" (06); "V97E" (06); "V97P" (06)
41	"GCOMPVER" (06, after N30 loads R3)
42	"P30" (06)
43	"LONGPASS" (06, Rl and R3 blanked); "PASSOUT" (06); "P21PROG2" (06)
44	"V82CALL" (16); "V82GOFLP" (16)
45	"PROG22" (06, R1 and R2 blanked); "P30" (16); "R23CSM1" (16 replaced by 53); "VN1645" (16)
46	"DONOUN46" (04)
47	"DONOUN46" (06)
48	"DONOUN46" (06)
49	"P23.85" (06, R3 blanked); "RENDISP2" (06, priority display); "S22BOX12" (06, R3 blanked)
50	Manual initiation only (optional R30 display, R1 computed P00/P11)

```
Noun
                               Using Routine (Verb)
 51
          "SBANDANT" (06, R3 blanked)
          Manual initiation only (central angle of transfer computed in
 52
          P34/P74 and P35/P75)
 53
          "R31CALL" (16)
 54
          "R31CALL" (16)
          "P31" (06); "P34/P74C" (06); "P72" (06); "P74" (06)
 55
 56
          Manual initiation only (P37 targeting data)
          "P34/P74C" (06)
 58
59
          Manual initiation only (line-of-sight velocity increment)
60
          "NEWRNVN" (06); "P37" (06, R1 blanked); "RTEVN" (06, R1 blanked)
          "P61" (06); "P62.1" (06); "RTEVN" (06, R3 blanked)
61.
62
          "VHHDOT" (06)
63
          "NEWRNVN" (16)
          "P63" (06)
64
65
         Manual initiation only (sampled computer clock)
66
         "PREFINAL" (06)
67
         "P67.1" (16)
         Manual initiation only (entry quantities)
68
         "P65.1" (16)
69
         "PROG22A" (05, Rl and R3 blanked); "P23" (05); "R51DSPA" (01,
70
         R2 and R3 blanked); "VlN70DSP" (01)
71
         "DOV5N71" (05, R1 and R3 blanked); "P23.60" (05); "R53C1" (01)
73
         Manual initiation only (quantities computed in P21)
         "INITROLL" (06)
74
         "P32/P72C" (06); "P33/P73B" (06)
75
78
         "DOV6N78" (06); "V89CALL" (06, R3 blanked)
```

Noun	Using Routine (Verb)
79	"DOV6N78" (06)
80	Manual initiation only (same as N4O, but R2 and R3 different scaling)
81	"N90/N81" (06); "P30" (06); "P32/P72C" (06); "P33/P73B" (06); "P76ER77" (06); "RTEVN" (06); "S34/35.5" (06)
82	"P32/P72C" (06)
83	"P47BODY" (16)
84	"P76ER77" (06)
85	"P4OSXTY" (06); "TIGAVEG" (16); "TIGNOW" (16)
86	Manual initiation only (same as N81, but different scaling)
87	"MARKDISP" (06, Rl and R3 blanked)
88	"PLANET" (06); "P23N7071" (06); "V1N70DSP" (06)
89	"P22SUBRB" (06); "P52B" (06); "S22I=N" (06)
90	"N90/N81" (06); "P32/P72C" (06); "P33/P73B" (06)
91	Manual initiation only (optics CDU angles)
92	"R53CHK" (06); "VBCOARK" (24)
93	"GCOMPVER" (06); "IMUFINEK" (25); "R55" (06)
94	"R23CSM" (06); "R56" (06)
95	"POSTTLI" (16); "P15JOB" (06); "TIGAVEG" (06)
96	"R36" (06)
97	Manual initiation only (DSPTEM1 cells for system test inputs)
98	"SHOW" (06)
99	"GOTOPOOH" (37, which then blanks noun register); "V67CALL" (06)

## Optics Computations

OPTTEST Entered from "PROCEEDE" every 0.24 seconds

Return (to routine calling "R57")

### Quantities in Computations

See also list of major variables and list of routines

ALPHAV: See Coordinate Transformations.

ALT: See Coordinate Transformations.

AOPANG: Rotation angle used in "ADVTRACK", scale factor BO, units revolutions. Uses same cell as AOPTIME, but separate tag used for clarity.

AOPOLD: Previous value of AOPTIME used in "RATESUB" to compute optics rates, scale factor B28, units centi-seconds.

AOPTIME: Value of R52 time used to compute optics pointing information for landmark or LM, scale factor B28, units centi-seconds. Except for use in advanced ground track mode, incremented in "R52D" in order to compensate for computing and optics hardware delays.

BESTI, BESTJ: See Inflight Alignment.

- Coduchkwd: Single precision erasable memory constant, program notation "CDUCHKWD", scale factor Bl4, used to specify (if positive non-zero) the number of centi-seconds delay before "MARKDIF" is performed after receiving an optics mark button input. If the cell is zero or negative, the delay is 0.01 second.
- C : Single precision erasable memory constant, program notation nopass'"NO.PASS", scale factor Bl4, used to specify how often a check should be made in "R52C" for a new mark from which to compute a revised landmark location. To check every nth time, cell should be set to n, since except for "PROG24" initial setting the loading of PASSCNT is done with the decremented value of the constant.
- C shaftsf "SHAFTSF", scale factor B25, units pulses per (revolution/centisecond). For a saturated error counter (384 pulses) corresponding to N degrees/second, cell should be set to 384 x 360 x (1/N) x 100 x 2-25, where first term is saturated error counter (600g), second converts from revolutions to degrees, third is reciprocal of full-scale error counter, fourth converts from seconds to centi-seconds, and fifth is scale factor. For 20°/second (approximate value in an earlier design), this formula gave 337.5 x 2-14.
- C: Single precision erasable memory constant, program notation trunsf"TRUNSF", scale factor B27, units pulses per (revolution/centisecond). For a saturated error counter corresponding to M degrees/second, cell should be set to  $384 \times 360 \times (1/\text{M}) \times 100 \times 2^{-27}$ , where terms have analogous meanings to those for C shaftsf. For  $10^{\text{O}}/\text{second}$  (approximate value in an earlier design), this formula gave  $\frac{1}{2}$  (337.5 x  $2^{-14}$ ).

C31FLWRD: See Digital Autopilot RCS Routines.

- CDUS: Single precision value of counter input cell 0036g, containing the optics CDU shaft angle (also identified with the X axis), scale factor B-1, units revolutions, in twos complement.
- CDUT: Single precision value of counter input cell 00358, containing the optics CDU trunnion angle (also identified with the Y axis), scale factor B-3, units revolutions, in twos complement. See K 20degs.
- CDUICMD (i = T, S): Single precision value of computer special erasable memory cells 0053<sub>8</sub> 0054<sub>8</sub> respectively (also identified as OPTYCMD and OPTXCMD respectively). Pulses are generated based on the contents of these cells if bits 12-11 respectively of channel 14 = 1, and the optics CDU error counter is loaded from the 3200 pps pulse train information if bit 2 of channel 12 = 1. For the position-command mode (bit 8 of channel 12 = 0), 2<sup>15</sup> pulses from CDUTCMD, and 2<sup>13</sup> pulses from CDUSCMD, give one revolution. For the rate-command optics mode (bit 8 of channel 12 = 1), a saturated error counter (384 pulses) is e.g. 10°/sec for CDUTCMD and 20°/sec for CDUSCMD. The same cells (in this "rate" mode, i.e. with error counter giving a steady voltage level output) are also used for TVCYAW and TVCPITCH commands for the SPS engine (see Digital Autopilot Interface Routines).
- COMMANDT, COMMANDS: Raw values of trunnion and shaft commands computed in "OPTTEST" for optics position-command mode, same scaling as CDUiCMD. The sign of COMMANDS may be reversed for shaft-stop avoidance purposes.
- ${\tt CSMPO\underline{S}: See\ Measurement\ Incorporation.}$
- DESOPMOD: Single precision value of SWSAMPLE the previous time that "OPTMON" was performed, used to determine if a change has taken place in the setting of the optics mode switches (Computer Control, Manual, or Zero).
- DESOPTS: Single precision values of desired CDUT and CDUS respectively, twos complement with same scaling as CDUT and CDUS respectively. They are used in "OPTTEST" to generate optics driving commands (if OPTIND and SWSAMPLE are satisfactory), and in "RATESUB" as the previous cycle's desired value for use in generating optics rate command information.

ERADM: See Coordinate Transformations.

EXTVBACT: See Verb Definitions.

IMODES33: See IMU Computations.

- $^{\rm K}$ 2p4secdp: Constant, program notation "2.4SECDP", scale factor B28, units centi-seconds. Value is 240 x  $^{\rm 2-28}$ , corresponding to 2.4 seconds.
- K<sub>19p77deg</sub>: Single precision constant, program notation "19.77DEG", scale factor B-3, units revolutions. Value is 61740<sub>8</sub>, corresponding to -7199 x 2<sup>-14</sup> (ones complement), but since is used (in "MARKDISP") in twos complement, is equivalent to -7200 x 2<sup>-14</sup>, or 19.7754° (added to raw optics trunnion angle to compute bias). See K<sub>20degs</sub>.
- $^{\rm K}$  20degs: Single precision constant, program notation "20DEGS", scale factor B-3, units revolutions. Value is 7199 x  $2^{-14}$ , but since used (in "ENDZOPT") in complement form, value equivalent to 7200 x  $2^{-14}$ , or 19.7754°. When the optics are "zeroed", the CDUT cell is loaded with  $^{\rm K}$  20degs: consequently, to find the "true" trunnion angle, this 19.7754° value must be added, and to convert "true" to actual cell contents this 19.7754° value must be subtracted. See e.g. "CALCSXA". Octal is 617408 (set).
- $^{
  m K}_{
  m 20dgsmn}$ : Constant, program notation "20DEGSMN", scale factor B-3, units revolutions. Value is -7199 x  $2^{-14}$  (as a ones complement number), equivalent to -19.7754° (see  $^{
  m K}_{
  m 20degs}$ ). Causes limiting of trunnion value if the derived "true" angle is negative.
- K<sub>45dg</sub>: Single precision constant, program notation "13,14,15", scale factor B-1, units revolutions. Value is 70000, corresponding to a value of 10000, as used in program (after a one-bit correction for convenience in forming absolute value), or 45°. If CDUS is = or less than this value, then ZONE is set 0; if greater and ZONE is zero, then ZONE is set to CDUS.
- K<sub>5</sub>Odgtr: Constant, program notation "38TRDEG", scale factor B-3, units revolutions. Value is 0.66666667, corresponding to 30° in the value of CDUT, or a "true" trunnion angle of 30 + 19.7754 = 49.7754° (see K<sub>2</sub>Odegs). Constant formerly was 0.4 (a "true" value of 37.7754°), hence the notation.
- K90dgB-l, units revolutions. Value is 57777g, corresponding to a value of 2000lg as used in the program (after a one-bit correction for convenience in forming absolute value), or about 90°. If CDUS magnitude is less than 90°, then there is considered to be no problem with the optics stops.
- Km3bt: Single precision constant, program notation "NEG2", scale factor B-1, units revolutions. Value is -2 x 2-14, but used in program in such a way (for convenience in forming absolute value) that effective value in program is -3, or about -0.033°. A change in an IMU CDU angle of more than 3 least increments in C centi-seconds causes the optics mark to be rejected in "MARKDIF", except for P24.
- K : Single precision constant, program notation "-MAXSRT", scale factor Bl4, units pulses. Value is  $-384 \times 2^{-14}$ , corresponding to -384 (the complement of the value of a saturated error counter, which is  $600_8 = 384$ ).

- K mperiod: Constant, program notation "MPERIOD", scale factor B-4, units revolutions (of moon) per orbit (of CSM). Value is 0.047619. For a lunar rotation rate of 2.66169947E-6 rad/sec (see K in Orbital Integration), this would be an orbit period of about 117.1 minutes. This time is the period of a circular orbit about 50 nmi above the mean lunar radius.
  - Example 1: Single precision constant, program notation "MAXPLS", scale factor maxps B14, units optics CDU output pulses. Value is -83 x 2-14. See CDUiCMD above for pulses/revolution, noting that a scale factor for single precision information of B1 revolutions is equivalent to a scale factor of B14 pulses if 2<sup>13</sup> pulses = 1 revolution.
  - K : Single precision constant, program notation "MAXPLS1", scale factor Bl4, units optics CDU output pulses. Value is  $-82 \times 2^{-14}$ , but used in program (for convenience in forming absolute value) in such a way that effective value is -83 (see K  $_{\rm mxps}$ ).

 $^{\rm K}$  p5secdp: Constant, program notation ".5SECDP", scale factor B28, units centi-seconds. Value is 50 x 2<sup>-28</sup>, corresponding to 0.5 seconds.

LANDALT, LANDLONG: See Orbital and Rendezvous Navigation.

LANDMARK: See Orbital and Rendezvous Navigation.

MARKDATA: See Measurement Incorporation.

MARKDOWN: See Measurement Incorporation.

- MARKINDX: Single precision cell, scale factor Bl4, loaded in "SXTMARK" with 5 for P22/P24, and with 1 for other programs, and modified in "MARKDIF" so as to contain the count of the number of marks remaining (except for P24, when returned to original value). It is incremented in "MKREJCT" (except P24) when a mark is rejected. Used in "R53" (except for P24) to force at least one mark to be processed before termination of the mark sequence.
- MKCDUi, MKT2Tl: Set of buffer cells loaded in "MARKRUPT" with optics and IMU CDU angles (with time in MKT2Tl, double precision), and used in "MARKDIF" to load appropriate cells. The sequence of the cells in memory is MKT2Tl<sub>dp</sub>, MKCDUY, MKCDUS, MKCDUZ, MKCDUT, and MKCDUX.
- MRKBUF1: Set of cells loaded in "PUTMARK" with optics mark information for those programs not using the SVMRKDAT set (i.e. except for P22 and P24). Sequence of cells has data as described above for MKCDUi, MKT2T1. For common use of processing routines, "R23CSM1" and "R56" load these cells with information in the same format as that done for normal optics marks. For R22 use, a setting of MRKBUF1 to a negative number indicates that no mark data are in the cells. In that program, a mark reject (or V86E) must be done sufficiently promptly after a mark to avoid having it be incorporated (barring the N49 display). The notation "MRKBUF1" refers to the first cell of the set, i.e. MRKBUF1+0 (there are 7 cells in the set).

NUM8NN: See Orbital and Rendezvous Navigation.

OPTCADR: Single precision cell used to contain return address for "SXTMARK".

OPTIND: Single precision control cell, scale factor Bl4, used to control the performance of "OPTTEST". If it is negative, including -0, driving of the optics is bypassed. A setting of -O means that the optics are "reserved": this setting is done in "S40.6" when the output channel bits are set for TVC use (see CDUiCMD above). The setting to -1 is done in e.g. "INITSUBA" in conjunction with V37 processing.

OPTMODES: Single precision flag word used for control of "T4RUPT" computations associated with the optics hardware. The individual bits have the following meanings:

<u>Bit</u>	Symbol	<u>Meaning</u>
10	ZROPTFIN	Zeroing of optics has been completed since last fresh start or restart if bit is 1.
7	OCDUFBIT	Nominal last sampled value of channel 30 bit 7 (0 if an optics CDU fail indication has been generated by the optics CDU hardware). If OPTIND = -0, the value of the bit is not changed in "OPTMON", although a channel 30 bit 7 change will cause "OCDUFTST" to be entered to change bit 8 of DSPTAB+11 (the Tracker light).
5	OPMDlBIT	Last sampled value of channel 33 (or C31FLWRD) bit 5: zero if Computer Control mode of optics desired.
4	OPMD2BIT	Last sampled value of channel 33 (or C31FLWRD) bit 4: zero if Zero Optics mode of optics desired. If bits $5-4=11_2$ , Manual mode of optics desired.
3	ZOPTCS	Bit set 1 in "CSCTOZOP" to indicate that the wait for zeroing of optics is in process. It is set zero in "ENDZOPT", after the completion of the necessary wait.
2	OCDUINHT	Bit set 1 to inhibit generation of Tracker alarm (bit 8 of DSPTAB+11) within "OCDUFTST" routine.

P22DEX: Single precision cell, scale factor B14, used to select the appropriate set of SVMRKDAT cells to be loaded in "MARKDIF" for P22 and P24: it equals the first cell of the SVMRKDAT set which is to be loaded when the next mark is received (decremented by 7 for a P22 mark reject).

PAC: See Coordinate Transformations.

- PACTEMP: Single precision cell, same scaling as PAC, used to retain the value of PAC derived in R52, with limiting if necessary, that is subsequently loaded into DESOPTT.
- PASSCNT: Single precision counter, scale factor Bl4, initialized using

  C in "PROG24" and used in "R52C" to determine if a check should be made for a P24 mark upon which a revised landmark location computation should be based.
- PDULOS: Value of unit line-of-sight information used in "ADVTRACK", scale factor Bl, stored in push-down list location OD.
- R53EXIT: Single precision cell containing return address from "R53" or "R56" (allowing "R53Cl" to be used by both).
- RATETEMP: Pair of cells used in "RATESUB" for temporary storage purposes.

  Detail shown there since same cells used for (VHFCNT, TRKMKCNT). See
  Measurement Incorporation.

S22RHO: See Orbital and Rendezvous Navigation.

S22TOFF: See Orbital and Rendezvous Navigation.

SAC: See Coordinate Transformations.

SAVQR52: Single precision cell containing return address from "R52".

- SOLD: Value of present shaft-driving error counter used for the rate mode of the optics, scale factor Bl4, units pulses. Cell required because error counter driven from CDUSCMD cell to change value, but SRATE contains the desired value itself. SOLD zeroed in e.g. "CSCTOMAN", where zeroing of bit 2 of channel 12 also zeros the error counter.
- SRATE: Value of desired shaft rate, scale factor Bl4, units pulses (see C shaftsf). The cell is set 0 in "OPTTEST" if necessary to avoid the shaft stop.
- SRTEMP: Temporary storage for new shaft rate derived in "RATESUB", to avoid changing SRATE cell prior to limiting and to allow both SRATE and TRATE to be changed effective with the same optics interrupt.
- STAR: See Coordinate Transformations. Used in "R52D" to retain temporarily the position vector of LM or landmark (scale factor B29, units meters). In "ADVTRACK" it is used to retain the unit vectors, scale factor B1, about which rotation is performed.

STARCODE: See Inflight Alignment.

STARIND: See Inflight Alignment. Set 0 in "ROO" so that "R52D" will select STARSAV2 for e.g. P23.

STARSAV1, STARSAV2: See Inflight Alignment.

SYMRKDAT: See Orbital and Rendezvous Navigation.

SWSAMPLE: Single precision cell containing information on the value of the optics hardware mode last sampled in "OPTMON" (DESOPMOD is loaded with the same value before termination of the routine). A positive non-zero value (i.e. 15) means Computer Control mode; a zero value means Manual mode; and a negative value (-1) means Zero Optics mode. Scale factor is Bl4.

T<sub>st</sub>: See Data Input/Output.

TOLD: Value of present trunnion-driving error counter used for the rate mode of the optics, scale factor Bl4, units pulses (see SOLD).

TRATE: Value of desired optics trunnion rate, scale factor Bl4, units pulses (see  $C_{\rm trunsf}$ ).

TRTEMP: Temporary storage for new trunnion rate derived in "RATESUB" (see SRTEMP).

TRUNBIAS: Single precision value of trunnion bias angle, scale factor B-3, units revolutions, computed in "MARKDISP" (in R57) for use in "P23.85" (part of P23). Nominal "true" trunnion angle for the R57 procedure is zero (hence K 19p77deg is subtracted from the observed angle cell contents

UM: See Measurement Incorporation.

WTOPTION: Single precision cell, scale factor Bl4, set to ll in "OPTMON" if switch from Zero to Manual optics mode with zeroing not yet complete (alarm Oll6, is generated also). It is decremented by 1, with a lower limit of +0, when "OPTMON" is entered with previous and present cycle modes both Manual. If switch back to Zero from Manual before counter decremented to 0 (which occurs in about 5.3 seconds), then ZOPTCNT is not reset to 32. Cell set 0 in "CSCTOZOP" and in "OPTMON" if go from Zero to Computer Control.

X789: See Measurement Incorporation (no "measurement incorporation routines" of the P22 type used for P24, of course).

ZONE: Single precision cell set 0 in "ENDZOPT" or in "OPTTEST" if CDUS magnitude less than 45°, and set in "OPTTEST" if CDUS magnitude exceeds 45° and cell presently 0. It is used in "OPTTEST" in the implementation of the optics shaft stop monitor (if non-zero, only its sign is employed). Cell is required because optics shaft stops are at ½ 270° from "zero" ("zero" is the position at which optics are left after zero mode employed). If, after zeroing, were to drive optics towards e.g. +70°, then when CDUS exceeded 45° ZONE would be set to positive non-zero. If continued to drive in the same direction, e.g. to +100°, then +140°, then +170° (always with increments of less than 180° from present CDUS, so go "shortest" way, namely in same direction), then ZONE would remain positive non-zero and optics would continue to drive. If, from the 170° point, the next DESOPTS were -160° (or, equivalently, +200°), then "shortest distance" would again be the 30° across the 180° point, and the optics would be driven there, with ZONE remaining untouched (CDUS reading would be "-160°"

when reach DESOPTS). Note that, however, if had started at the "zero" point, would have driven optics in the opposite direction (i.e. though -30, -70, etc.). If the next DESOPTS were e.g. -100°(i.e. +260°), then here the optics would again be driven in the same direction, with ZONE unchanged, from -160° to -100°, or only 10° away from the stop at +270° (note that "normal" method of reaching -1000, from "zero", would have gone the other way). At the  $-100^{\circ}$  (actually  $+260^{\circ}$  as far as how shaft angle got there is concerned) point, ZONE is still positive non-zero. If the next DESOPTS were e.g.  $-60^{\circ}$  (i.e.  $+300^{\circ}$ ), this would generate a COMMANDS of  $(-60^{\circ})$  -  $(-100^{\circ})$  =  $+40^{\circ}$ : to drive there directly, however, would require violating the hardware stop at 270°, and hence the stop monitor logic is invoked. With these conditions, all the conditions at the top of page OPTC-2 are satisfied, since CDUS magnitude (100°) exceeds 90°; ZONE ≠ 0; the sign of ZONE = sign of COMMANDS (both positive); and magnitude of DESOPTS is 60° (less than 90°). Consequently, the COMMANDS polarity is reversed, so that instead of driving towards -60°, the optics are driven towards -140° (-100 + -40). Assuming that DESOPTS remains -60°, the next attempt would be to drive towards  $-220^{\circ}$  (+140°, i.e. -140 -(-60 --140)), and so on. When CDUS is driven below 90°, then shaft stop logic is no longer involved, since "shortest path" is likewise one that avoids the optics shaft stops. Finally, when optics reaches the -600 point (the "long way"), ZONE would have been reset to 0 and then to negative nonzero, to protect the stop at -270° (+90°). If the value of DESOPTS were to "chatter" near a magnitude of 270, then the optics themselves would be driven in alternating directions: in this case, manual selection of optics zeroing should be done.

ZOPTCNT: Single precision cell, scale factor B14, set to 32 at the start of optics zeroing (assuming no WTOPTION effect), to give an optics zeroing period of 33 x 0.48 + 0.4 \$\frac{16.2}{2}\$ seconds. An alarm (pattern 116) is generated if switch out of zeroing before completion of initial part of delay (about 15.8 seconds from when switch first sensed to be in zero mode). See WTOPTION (no setting of WTOPTION is made if switch to Computer Control: it is reset to 0 instead).

# Orbital Integration

STATEINT Called by "ENDINT", and restarted via group 2.3

Establish "STATINT1" (priority 05g)

End of task

STATINT1 Established by "NDUTINPT" if bit 9(UTFLAG) of FLAGWRD8 = 1, by "STATEINT", and by restart group 2.5 (in "ROO" for POO)

If bit 5(QUITFLAG) of FLAGWRD9 = 1: (set by "VERB96")

Make restart group 2 inactive

Set bit 5(QUITFLAG) of FLAGWRD9 = 0

End of job (must key e.g. V37EOOE to get periodic integration)

 $T_{\text{decl}} = T_{\text{now}}$ 

Set bit 3(V96ONFLG) of FLAGWRD8 = 0

Perform "INTSTALL"

Set bit 1(NODOV37) of FLAGWRD2 = 1

Set bit 5(STATEFLG) of FLAGWRD3 = 1

Set bits 4(CONICINT), 2(9DIMWMAT), and 1(WMATINT) of FLAGWRD3 = 0

Set bit 14(JSWITCH) of FLAGWRDO = 1

COLREG = -15

If bit 2(9DIMWMAT) of FLAGWRD3 = 1:

COLREG = -24

Proceed to "NEXTCOL"

#### NEXTCOL

 $Y\underline{V} = \underline{W}_{-COLREG}$  (shifted right 3 places)

 $Z\underline{V} = \underline{W}_{27-\text{COLREG}}$  (shifted right 3 places)

DIFEQCNT = O

ALPHAV = YV

H = O

Proceed to "DOW.."

DOW..

X2 = PBODY

BETAM = K muer\_X2

 $T\underline{S} = VECTA\underline{B}_{DIFEQCNT}$ 

$$F\underline{V} = \frac{3 \text{ (ALPHA}\underline{V} \cdot \text{unitT}\underline{S}) \text{ unitT}\underline{S} - \text{ALPHA}\underline{V}}{||\mathbf{T}\underline{S}||^3}$$
BETAM

If bit 13(MIDFLAG) of FLAGWRDO = 0, proceed to "NBRANCH"

X2 = - PBODY

 $\mathtt{BETAM} = \mathtt{K}_{\mathtt{muer}}_{-\mathtt{X2-2}}$ 

 $T\underline{S} = VECTA\underline{B}_{6-DIFEQCNT}$ 

$$T\underline{S}_{1} = \frac{3 (ALPHA\underline{V} \cdot unitT\underline{S}) unitT\underline{S} - ALPHA\underline{V}}{|T\underline{S}|^{3}}$$
 BETAM

If bit 12(MOONFLAG) of FLAGWRDO = 0:

Shift  $TS_1$  right 6 places

 $F\underline{V} = F\underline{V} + T\underline{S}_1$  (scale factor is ALPHAV scale minus 38)

Proceed to "NBRANCH"

# Quantities in Computations

See also list of major variables and list of routines

- A<sub>5</sub>: Intermediate quantity used in "KEPPREP", scale factor B7 (earth) or B5(moon), stored in push-down list location 4D (corresponds to gamma times square root of mu).
- ALPHAM: Value of magnitude of ALPHAV (before ALPHAV made a unit vector), same scaling and units.
- ALPHAV: Cell used for several purposes. When initially enter "ACCOMP", contains position deviation scaled B22 (earth) or B18 (moon) meters. Subsequently loaded with unit(ALPHAV), scale factor B1. Is then set to unit position vector (originally BETAV information), with scaling for ALPHAM correspondingly B29 (earth) or B27 (moon), and retains this setting when "OBLATE" entered. When W matrix computations are done, is used to contain value of YV (W\_COIREG) information. Can also be used as internal communication cells with coordinate transformation routines.
- BETAM: Value of magnitude of BETAV (before BETAV made a unit vector), same scaling and units. Also used in "DOW.." to contain K muer;
- BETAV: Vector giving vehicle position with respect to body whose acceleration effect is being computed, units meters. In "ACCOMP", initial scale factor B29 (earth) or B27 (moon). If bit 13 (MIDFLAG) of FLAGWRDO = 1, subsequently contains position vector to "secondary body", scale factor B29, and then position vector to sun, scale factor B38.
- $\underline{\mathbf{C}}_{504lm}$ : See Coordinate Transformations.
- Ce32c3lrm: Single precision erasable memory constant, program notation "E32C3lRM", scale factor B8O, giving information on moon's C<sub>31</sub>, containing  $\rm C_{31} \times 1.5 \times r_{\rm M}^3 \times mu_{\rm m}$ . For a value VALC31, the fraction in the cell may be computed as VALC31 x 1.5 x (1.73809E6)<sup>3</sup> x 0.4902778E9 x 2<sup>-80</sup>. This fraction should not be  $\frac{1}{2}$  or more (VALC31 above about 15.5E-5) to avoid overflow when divided by normalized ALPHAM.
- <sup>C</sup>e3j22r2m: Single precision erasable memory constant, program notation "E3J22R2M", scale factor B58, giving information on moon's J<sub>22</sub>, containing J<sub>22</sub> x 3 x r<sub>M</sub><sup>2</sup> x mu<sub>m</sub>. For a value VALJ22, the fraction in the cell may be computed as VALJ22 x 3 x (1.73809E6)<sup>2</sup> x 0.4902778E9 x  $2^{-58}$ .
- COLREG: Single precision cell ("column register") used to control the indexing in "DIFEQ+2" and "NEXTCOL" for the appropriate number of elements of the W matrix, scale factor Bl3 (since W matrix elements double precision).

- COSPHI: Argument for "OBLATE" equations, program notation "COSPHI/2", scale factor Bl, stored in push-down list location 18D. It is the cosine of the angle between the unit polar vector (of earth or moon) and the position vector (earth or moon centered respectively).
- DELTAY of CSM and LM respectively, same scaling as TDELTAY. Program notation DELTACSM and DELTALEM.
- DIFEQUNT: Single precision cell, scale factor Bl4, used for program control purposes, having values 0, -12, and -24 at the beginning, middle, and end of each integration step. It is negative for convenience in using interpreter indexing orders, and it is stepped by 12 to facilitate storage of a pair of double precision vectors (in VECTAB) during each pass.
- DTd2: Value of limited time increment for orbital integration, scale factor Bl9, units centi-seconds (is actually  $\frac{1}{2}$  the value of the net increment, e.g. beginning to middle or middle to end). It is derived in "TESTLOOP".
- EGRESS: Single precision cell used to retain return address information (e.g. from "AVETOMID").
- FOFQ: Function of LIIQ used in "GAMCOMP", scale factor (for FOFQ/RHO) B3. Program does not actually divide by RHO, but instead computes FOFQ/RHO directly: FOFQ computation shown as given, however, to facilitate comparison with published equation information.
- F<u>V</u>: Value of disturbing acceleration (second time derivative of position deviation), scale factor B-16(earth) or B-20 (moon) in meters/cs<sup>2</sup>. Same cell used in "DOW.." for W-matrix updating, where scale factor is 38 less than ALPHA<u>V</u> scale factor.
- H: Value of time since beginning of integration step, scale factor B19, units centi-seconds.
- IRETURN: Single precision cell used to retain return address information from the subroutine entered to use the orbital integration package (after "INTSTALL" logic has given control of the package to the routine used).
- IRETURN1: Single precision cell used to retain return address information from "MIDTOAV1" and "MIDTOAV2". If "MIDTOAV1" is entered (meaning that integration to a specified time is desired) but insufficient time is available to do the integration, then the time is slipped and IRETURN1 is incremented by 1 (to return to calling address +2) for appropriate disposition by caller. If enter "MIDTOAV2", cell is not incremented.

KEPRIN: See Conic Routines.

K<sub>3csecs</sub>: Constant, program notation "3CSECS", scale factor B28, units centi-seconds, used as exit tolerance from "CKMID2". Value is 3 x 2<sup>-28</sup>, corresponding to 0.03 seconds (meaning an exit if time difference is 0-2 centi-seconds).

K<sub>3d4</sub>: Constant, program notation "3/4", used in "RECTEST" to check if rectification is required. Value corresponds to 0.75, with scaling same as that of the vector with which compared. Hence for earth will rectify if TDELTAY magnitude is 0.75 x 2<sup>22</sup> meters or more, or if TNUV magnitude 0.75 x 2 meters/csec; for moon will rectify if TDELTAY magnitude 0.75 x 2 meters or more, or if TNUV magnitude 0.75 x 2 meters/csec(or more, of course).

K<sub>5p6secs</sub>: Constant, program notation "5.6SECS", scale factor B28, units centi-seconds. Value is  $560 \times 2^{-28}$ , corresponding to 5.6 seconds (to ensure that calling routine can successfully blank DSKY for 5 seconds).

 $^{\rm K}$ 600sc: Constant, program notation "600SECS", scale factor B28, units centi-seconds. Value is 60000 x  $2^{-28}$ , corresponding to 600 seconds.

K scale: Set of single precision constants used to control performance i of "GAMCOMP" as selected by the value of index. Program notation for i = 0 is "ASCALE". Values for even "i" give the difference between ALPHAM and BETAM scalings, for use in determining the proper scaling of RHO:

i	Value	ALPHAM scale	BETAM so	cale
0	-7	22	29	(earth, primary)
-2	-9	18	27	(moon, primary)
-4	0	29	29	(earth, secondary)
-6	-2	27	29	(moon, secondary)
-8	-9	29	38	(earth, sun)
-10	-11	27	38	(moon, sun)

Values for odd "i" are used to determine (with RHO scaling information above) the proper scaling of FV information: B-16 for earth and B-20 for moon. These values for earth are  $(16-2 \times BETAM \text{ scaling} + \text{mu scaling})$  and for moon are  $(20-2 \times BETAM \text{ scaling} + \text{mu scaling})$ : the "2" factor is required because BETAM is in computations.

<u>i</u>	Value	2 x BETAM scale	Mu scale	
1	-6	58	36	<pre>(earth, primary) (moon, primary) (earth, secondary) (moon, secondary) (earth, sun) (moon, sun)</pre>
-1	-4	54	30	
-3	-12	58	30	
-5	-2	58	36	
-7	-6	76	54	
-9	-2	76	54	

Kdt2mn: Constant, program notation "DT/2MIN", scale factor B20, units centi-seconds. Value is 3 x 2-20, corresponding to 0.03 seconds (hence "TESTLOOP" exits, since original input B28 centi-seconds, if time difference is 0-2 centi-seconds). Could also be considered a minimum for DTd2, in which case value would correspond (scale factor B19) to 0.015 seconds.

K<sub>dt2mx</sub>: Constant, program notation "DT/2MAX", scale factor B20, units centi-seconds. Value is 4000E2 x 2<sup>-20</sup>, corresponding to 4000 seconds. Could also be considered a maximum of DTd2, in which case value would correspond (scale factor B19) to 2000 seconds.

- K<sub>j20</sub>: Constant, program notation "J2REQSQ", scale factor B72, selected for index value = 0. Value is 1.75501139E21 x 2<sup>-72</sup>, corresponding to 3.986032E10 x (6.378165E6)<sup>2</sup> x (1082.3E-6) x 2<sup>-72</sup>, where first term is earth (in meters /cs²), second is square of earth's radius (gravitational, in meters), and third is second harmonic of earth's potential function (note that 1.5 times it = 1.62345E-3), while 4th is scale factor.
- K j2 : Constant, program notation "J2REQSQ -2", scale factor B60, selected -2 for index value = -2 (i.e. X2 = 2). Value is 0.3067493316E18 x  $2^{-60}$ , corresponding to .4902778E9 x (1.73809E6) x (0.207108E-3) x  $2^{-60}$ , where first term is moon's  $\mu$  (in meters /cs²), second is square of moon's radius (in meters), and third moon's  $J_2$  (4th scaling).
- K j3 j2 : Constant, program notation "2J3RE/J2", scale factor B27, selected 0 for index value = 0. Value is -0.1355426363E5 x  $2^{-27}$ , corresponding to -0.23E-5 x 6.378165E6 / 1082.3E-6 x  $2^{-27}$ , where first term is third harmonic of earth's potential function, second is earth radius in meters, and 3rd is second harmonic, while fourth is scaling.
- K : Constant, program notation "2J3RE/J2 -2", scaled B25, selected -2 for index value = -2 (i.e. X2 = 2). Value is -176236.02 x  $2^{-25}$  (stored value merely the integer), corresponding to (-2.1E-5)/(0.207108E-3) x 1.73809E6 x  $2^{-25}$ , where first term is moon's  $J_3$ , second is moon's  $J_2$ , third is moon's radius in meters, and fourth is scale factor.
- \*\*Example 1.1.\*\* Constant, program notation "J4REQ/J3", scale factor B26, selected of for index value = 0. Value is 0.4991607391E7 x  $2^{-26}$ , corresponding to -1.8E-6 x 6.378165E6 / -0.23E-5 x  $2^{-26}$ , where first term is fourth harmonic of earth's potential function, second is earth radius in meters, 3rd is third harmonic, and fourth is scaling.
- K j4j3 = Constant, program notation "J4REQ/J3 = -2", selected for index value = -2, value 0 (since  $J_4$  for moon is 0).
- K : Constant, program notation "MUEARTH", scale factor B36, selected 0 for index value = 0.3 Value is 3.986032E10 x 2-36, corresponding to earth (in meters /cs ).
- K : Constant, program notation "MUEARTH -2", scale factor B30, -2 selected for index value = -2 (e.g. X2 = 2). Value 3 is 4.902778E8 x  $2^{-30}$ , corresponding to moon  $\mu$  (in meters  $2^{-30}$ ).
- Komegmoon: Constant, program notation "OMEGMOON", scale factor B-23, units radians/centi-second. Value is 2.66169947E-8 x 2<sup>23</sup>, corresponding to 2.66169947E-6 rad/sec. Octal value is 2.66169948E-6.
- $K_{p3d}$ : Constant, program notation ".3D", scale factor B2, value 0.3 x  $2^{-2}$ .

- Krde : Constant, program notation "RDE", scale factor B29, units meters 0 (selected for index value = 0), giving distance from center of earth beyond which "OBLATE" computations are bypassed. Value is 80467.20E3 x 2<sup>-29</sup>, corresponding to 80,467.20 km, or 50,000 statute miles (5280 feet/statute mile).
- Krde -2 B27, units meters (selected for index value = -2), giving distance from center of moon beyond which "OBLATE" computations are bypassed. Value is 16093.44E3 x 2<sup>-27</sup>, corresponding to 16,093.44 km, or 10,000 statute miles.
- K
  recrat: Constant, program notation "RECRATIO", scale factor BO, value
  0.01.
- Krme Constant, program notation "RME", scale factor B29, units meters (selected for index value = 0), giving distance from center of earth beyond which bit 13(MIDFLAG) of FLAGWRDO is set to 1 in "TESTLOOP". Value is 7178165 x 2<sup>-29</sup>, corresponding to 800 km above gravitational radius of 6378.165 km. Actual stored value (due to scaling) is 7178166 meters. See "V83CALL".
- Krme -2 B27, units meters (selected for index value = -2), giving distance from center of moon beyond which MIDFLAG is set. Value is 2538.09E3 x 2<sup>-27</sup>, corresponding to 800 km above mean lunar radius of 1738.09 km. See "V83CALL".
- Krsphere: Constant, program notation "RSPHERE", scale factor B29, units meters, giving the value of the distance from the center of the moon below which the moon is considered the primary body (check made in "TIMESTEP"). Value is 64373.76E3 x 2<sup>-29</sup>, corresponding to 64,373.76 km, or 40,000 statute miles. Checked also in "A-PCHK".
- $^{
  m K}$  : Constant, program notation "TIMEDELT", scale factor B28, units centi-seconds. Value is 1250 x  $2^{-28}$ , corresponding to 12.5 seconds.
- LIIQ: Value for argument of FOFQ, scale factor B2, stored in push-down list location 8D.
- LOCCTR: See Display Interface Routines.
- [MMATRIX] : See Coordinate Transformations.
- MUpPp: Value of 

  for the primary body left in push-down list location

  26D by "RECTOUT", same scale factor as corresponding K
  earth, B30 for moon). Program notation "MU(P)".

  (B36 for
- $NUV_{cm}$ ,  $NUV_{lm}$ : "Permanent" values of  $TNUV_{lm}$  for CSM and LM respectively, same scaling as  $TNUV_{lm}$ .

- P2', P3', P4', P5': Legendre polynomial derivatives computed in "OBLATE", scale factors B6, B5, B7, and B10 respectively, stored in push-down list locations OD, 2D, 4D, and 6D (partially) respectively.
- PBODY: Single precision cell set 0 in "INTEGRV" and subsequently updated if necessary, scale factor BL4. Value is 0 for earth-centered measurement and 2 for moon-centered measurement. It is used to initialize interpretive language index register X2, which is in turn used to select appropriate information for earth or moon (including the number of binary shifts required).
- PHIV: Storage for information used in Nystrom numerical integration, scaled (for state vector updates) B-13(earth) or B-17(moon).
- PSIV: Storage for information used in Nystrom numerical integration, scaled (for state vector updates) B-13(earth) or B-17(moon).
- QARG: Intermediate quantity used in "KEPPREP", computed in quasi-floating point fashion, with scaling (for numerator and denominator already normalized) BO(earth) or B2 (moon). It corresponds to s divided by the square root of mu, and is stored in push-down list location 4D. Hence A<sub>5</sub> QARG has scale factor B7 for both earth and moon.
- QPRET: Single precision cell assigned to each job in the interpretive language, which may be used to retain return address information. Cell is preloaded with proper exit address from orbital integration system of routines before transfer to "INTWAKE"; before using the orbital integration package, subroutine "INTSTALL" is performed which returns immediately to the calling routine if the orbital integration package is not already in use by another user (at a lower job priority), and otherwise retains in QPRET the return address to the routine calling "INTSTALL".
- $\underline{\underline{R}}_{nl}$ : See General Program Control.
- $\underline{\underline{R}}_{\text{other}}$ : Position vector of "other" vehicle (i.e. LM) transmitted on downlink, scale factor B29, units meters. Same B29 scale factor applies whether moon or earth is central body.
- $\frac{R}{rect}$ : Value of position vector within orbital integration (when last rectification or equivalent function was performed), scale factor B29(earth) or B27(moon), units meters.
- $\frac{R}{rectcm}$ ,  $\frac{R}{rectlm}$ : "Permanent" values of  $\frac{R}{rect}$  for CSM and LM respectively, same scale factor and units as  $\frac{R}{rect}$ .

- RCV: Value of conic position vector within orbital integration routine, scale factor B29(earth) or B27(moon), units meters. Also used as communication cell with orbital integration package (when entered via "INTEGRVS") to specify the position component of the state vector to be integrated.
- $\frac{RCV}{cm}$ ,  $\frac{RCV}{lm}$ : "Permanent" value of  $\frac{RCV}{lm}$  for CSM and LM respectively, same scale factor and units as  $\frac{RCV}{lm}$ .
- RHO: Ratio of magnitudes of ALPHAV and BETAV (before becoming unit vectors) computed in "GAMCOMP", scale factor Bl, stored in pushdown list location 4D.
- RLS: See Coordinate Transformations.
- RFQV: Position of secondary body with respect to primary body, scale factor B29, units meters. If bit 15(RPQFLAG) of FLAGWRD8 = 0, this means that the vector has been loaded for current integration time; if the bit is 1, this means that the vector must be computed (bit initialized to 1 when integration package entered).
- RPSV: Position of sun with respect to primary body, scale factor B38, units meters. Computed in "LSPOS" (and left in push-down list location 2D) with respect to earth, and subsequently changed in "ACCOMP" to be with respect to moon if necessary.
- RTX1, RTX2: Single precision values of index registers X1 and X2 loaded in "MIDTOAV2" with values at exit from integration ("RECTOUT"), used to identify nature of origin of state vector (also loaded elsewhere: see Rendezvous Computations).
- T: Time (as of start of integration cycle) since last rectification, scale factor B28, units centi-seconds. Set 0 in "RECTIFY", and incremented in Kepler computations (see Conic Routines).
- $^{\rm T}$  ccm,  $^{\rm T}$  : "Permanent" value of  $^{\rm T}$  for CSM and LM respectively, same units and scaling.
- Tdec: Value of "decision time", i.e. final value of time to which state vector must be integrated, scale factor B28, units centi-seconds.
- Tet: Value of the time associated with the orbital integration routine state vector, scale factor B28, units centi-seconds. It is incremented in "NBRANCH".
- Tetcm, Tetlm: "Permanent" value of Tet for CSM and LM state vectors respectively, same units and scaling. Tetlm is called "TETLEM", "TETOTHER", and "T-OTHER" in program.
- Tpptml: See IMU Computations.

- TAUORB: Time within integration cycle since last rectification (or total conic integration time required), scale factor B28, units centi-seconds. Program notation is "TAU.".
- TBASE2: Single precision cell used generally for retention of time base information for restart group 2 (see 3420.5-27), for waitlist restarts. Used in "INTWAKE" to permit retention of QPRET value for restart purposes (since QPRET of job involved would be lost if a restart generated, because it generally is in VAC area as described in 3420.5-27).
- TDELTAV: Vector position deviation (from conic) within orbital integration package, scale factor B22(earth) or B18(moon), units meters.
- TNUV: Vector velocity deviation (from conic) within orbital integration package, scale factor B3(earth) or B-1(moon), units meters/centi-second.
- TTOADD: Value of time increment used in "CKMID2" if MID1FLAG = 0, program notation "T-TO-ADD", scale factor B28, units centi-seconds. Normal value is the same as  $K_{\mbox{timedt}}$ , but it is incremented by that constant if the "CKMID2" check using  $K_{\mbox{5p6secs}}$  fails.
- URPV: Vehicle position vector information used in "OBLATE" for moon-fixed coordinate information, scale factor Bl, stored in 14D.
- $U\underline{X}$ : Lunar X-axis in reference coordinates used in "OBLATE", scale factor B1, stored in 32D.
- UZ: Lunar Z-axis (polar vector) in reference coordinates used in "OBLATE", scale factor Bl, stored in 20D. For earth is unit $\underline{Z}$ .
- $\underline{V}_{nl}$ : See General Program Control.
- Vother: Velocity vector of "other" vehicle (i.e. LM) transmitted on downlink, scale factor B7, units meters/centi-second. Same B7 scale factor applies whether moon or earth is central body.
- Vrect: Value of velocity vector within orbital integration (when last rectification or equivalent function was performed), scale factor B7(earth) or B5(moon), units meters/centi-second.
- $\frac{V}{\text{rectcm}}$ ,  $\frac{V}{\text{rectlm}}$ : "Permanent" value of  $\frac{V}{\text{rect}}$  for CSM and LM respectively, same units and scaling.
- VCV: Value of conic velocity vector within orbital integration routine, scale factor B7(earth) or B5(moon), units meters/centi-second. Also used as communication cell with orbital integration package (when entered via "INTEGRVS") to specify the velocity component of the state vector to be integrated.

- $VC\underline{V}_{cm}$ ,  $VC\underline{V}_{lm}$ : "Permanent" value of  $VC\underline{V}$  for CSM and LM respectively, same scale factor and units as  $VC\underline{V}$ .
- VECTAB: Temporary storage for values of position vector of vehicle, loaded in "ACCOMP" and used in "DOW.." for orbital integration updating of W matrix.
- $\underline{W}_{:}$ : See Measurement Incorporation.
- XKEP: Value of quantity used in previous cycle through Kepler's equation (program notation also "XPREV"), scale factor Bl7(earth) or Bl6 (moon). Set O e.g. in "RECTIFY". Units are meters.
- XKEP xKEP : "Permanent" value of XKEP for CSM and LM respectively, same scaling.
- XKEPNEW: "New" value of XKEP computed in "KEPPREP", scale factor B17 (earth) or B16(moon).
- $Y\underline{V}$ : Communication cell with integration routines, set to TDELTA $\underline{V}$  in "INTGRATE" and also used for W matrix updating.
- $Z\underline{V}$ : Communication cell with integration routines, set to  $\underline{TNUV}$  in "INTGRATE" and also used for W matrix updating.
